

4.1.6.2 Mud

The intermediate logging in the Brent Group was performed in a Bentonite/lignosulphonate mud with the characteristics as given below.

Rm = 0.511 ohm.m at 24°C	density	=	1.02 g/cm ³
Rmf = 0.241 ohm.m at 21°C	viscosity	=	58.0 s
Rmc = 1.490 ohm.m at 21°C	pH	=	11.0
	fluid loss	=	3.8 cm ³
	Barite	=	26%
	Potassium	=	0%

4.3 RFT MEASUREMENTS AND SAMPLING, 25/2-12

The RFT logging was performed 16.10.88. Two runs were made. During the first run, 19 valid pressure points, including two points characterized as supercharged, were taken. In addition; 1 point was tight. The second run was a sampling run; one segregated sample was taken at 3697.2 m RKB.

A separate run was carried out to perform fluid sampling. The sampling was performed with the strain gauge only for pressure readings. A segregated sample was taken at 3697.2 m RKB, by first filling the 2 3/3 gal chamber and then the 1 gal chamber.

The big chamber was drained on drill floor and contained:

- 3.5 l of filtrate
- 1 l of condensate/oil
- 1.8 m³ of gas at drill floor conditions

The 1 gal chamber was sealed of and sent to laboratory for analysis.

Table 4.3.1

4.5 FLUIDS, 25/2-12

Only one fluid sample is available, from well 25/2-12, that is the segregated RFT sample taken in the hydrocarbon zone at 3697.2 m RKB (3675.2 m MSL) It was not possible to recover any samples during testing (chapter 4.2) due to operational problems.

The 1 gal chamber from the RFT segregated sample was sealed off and sent to GECO Laboratory for analysis.

A single flash composition analysis and a constant mass expansion was performed the main results are given in table 4.5.1 below. The composition and liquid drop out curve can be found in appendix 4.2.

Table 4.5.1 Main PVT results

Reservoir conditions: 670 bara, 125°C

Flash conditions: 700 bara, 105°C to atmosphere and 15 °C

Reservoir fluid type	:	gas/condensate
Dew point pressure at 125°C	:	534 bara
Fluid density at reservoir conditions	:	413.1 kg/m ³
Condensate density, stock tank at 15°C	:	818.3 kg/m ³
Gas gravity	:	0.744
Flash GOR	:	1467 Sm ³ /Sm ³

4.9.4.2 Mud

The reservoir section was drilled with a Bentonite - Lignosulphonate mud with the following characteristics:

Density	=	1.95 g/cm ³
Salinity	=	8.5 g/l
Barite	=	28%
pH	=	11.6
Viscosity	=	58.0 _s

4.10 DST 25/2-12A

4.10.1 Introduction

Two tests were planned in order to investigate the fluid properties and the productivity vs depth. However, due to operational problems, only one test in the lower part of the formation was carried out.

The objectives of the test were :

- fluid sampling
- reservoir characteristics/productivity
- initial reservoir conditions
- boundaries

The tested interval was 3795 - 3805 mRKB (3653.8 - 3660.6 mMSL).

The test lasted 27 hours and gas-condensate was produced.

The test zone appeared to have low permeability, only around 5 mD.

4.10.3 Equipment

The test string is shown in P1 4.10.1 with components, depths and diameters. A total number of six pressure gauges were run in the test string :

GAUGE	LOCATION	STATUS
AMERADA	NIPPLE BELOW PACKER	LEFT IN HOLE
FLOPETROL FHPR-A (STRAIN)	NIPPLE BELOW PACKER	LEFT IN HOLE
FLOPETROL SDP (STRAIN)	CARRIER ABOVE PACKER	NO READINGS
FLOPETROL SDP (STRAIN)	CARRIER ABOVE PACKER	WORKED, OK
GEOSERVICES TERRATEK	CARRIER ABOVE PACKER	WORKED, OK
GEOSERVICES TERRATEK	CARRIER ABOVE PACKER (READING ANNULUS PRESSURE)	WORKED, OK

Two gauges read successfully the bottom hole testing pressure with good agreement between the two.

For PVT sampling the service company Petrotech was used. It ensured a good quality control of the sampling process. This company also provides the service of utilizing the "isokinetic technique" for separator gas sampling, which is supposed to allow quantification of the separator liquid carry over.

4.10.4 Flow/pressure results

The flow and pressure results are summarized in the table below:

CHOKE	1/64"	8	12	14
DURATION	hrs min	5 h 20'	5 h 55'	1 h 26'
Q _o	Sm ³ /d	33	82	111
Q _g	Sm ³ /d	63000	144000	198000
GOR	Sm ³ /Sm ³	1900	1750	1780
P _{wf}	bara	612	557	520
ΔP _{wf} (draw down)	bar	47.6	102.5	139.5
P _{wh}	bara	461	412	377
P _{wh-bh}	bar	151	145	143
T _{wh}	deg C	13.1	12.5	18.8
P _{sep}	bara	35.2	35.2	35.4
T _{sep}	deg C	62.8	61.8	66.6

4.12 FLUIDS 25/2-12A

4.12.1. Samples available

During the DST separator recombination samples were taken during flow on two choke sizes:

Choke	Sample sets (1 oil bottle + 2 gas bottles)
8/64"	1
12/64"	3 + 1 isokinetic gas bottle

4.12.2 PVT

At present (June 1989) 1 sample has been analyzed in laboratory (GECO). The analysis programme consisted of a single flash and a constant mass expansion. The main results are given below. The composition and liquid drop out curve can be found in appendix 4.3.

No results are yet available for the isokinetic sample.

Table 4.12.1 Main PVT results

Reservoir conditions	:	670 bara, 125°C
Flash conditions	:	670 bara, 125°C to atmosphere, 5°C
Reservoir fluid type	:	gas/condensate
Dew point pressure at 125°C	:	574 bara
Fluid density, reservoir conditions	:	404.6 kg/m ³
Condensate density, stock tank 15°C	:	815.7 kg/m ³
Gas gravity (air = 1)	:	0.713
Flash GOR	:	1688.9 Sm ³ /Sm ³

TABLES

LEGENDS OF TABLES AND FIGURES OF ORGANIC INVENTORY ANALYSES : ABBREVIATIONS, UNITS AND CUT OFFS

SAMPLE TYPE :

[ND=unwashed cuttings; DE=cuttings washed on site. The cuttings are washed or washed anew in the laboratory]

[CA=core; CL=sidewall core; TE=outcrop; BO=mud; XX=other or undetermined]

Q1 : Contaminations or cavings, affecting the Rock Eval and TOC analyses [I=high; M=medium; F=low;]

Q2 : Contaminations or cavings, affecting the organic extract [N=null or not detected]

IR : Insoluble residue after HCl attack (% weight of rock)

LECO TOC : Total organic carbon (% weight of rock)

ANALYSIS IOC : Insoluble organic carbon in chloroform (% weight of rock)

OC : Organic carbon without precision (total or insoluble)

ROCK EVAL Carried out on : [generally not performed if OC < .3%]

ANALYSIS RT : Total rock

RI_RT : Insoluble residue after HCl attack

RE : Rock extracted with chloroform

RI_RE : Rock extracted with chloroform, and after HCl attack

Measured parameters : [# : result not given because meaningless; <S : lower than the detection threshold]

Tmax : Temperature of S2 peak (°C) [meaningless if S2 small]

S1 : Free hydrocarbons in the rock (mgHC/g of rock) [meaningless if the analysis is performed on the extracted rock]

S2 : Hydrocarbons yielded by pyrolysis (mgHC/g of rock)

S3 : CO2 yielded by pyrolysis (mg CO2/g of rock)

Calculated parameters :

PI : Production Index = $S1/(S1+S2)$ [# : meaningless if S1 and S2 < .2]

HI : Hydrogen Index = $(S2/OC) \times 100$ (mg HC/g OC)

OI : Oxygen Index = $(S3/OC) \times 100$ (mg CO2/g OC) .. [to be used with caution for analyses carried out on RT or RE if OC < 2%;

IO>170 : mineral contribution to S3 peak]

IATROSCAN Fast and non preparative analysis of the chloroformic extract (quantity and composition)

ANALYSIS EOM: Extractable organic matter with chloroform (% weight of rock) [<S if lower than .01%]

Normalized composition of the extract (% EOM) : [not performed if EOM < .03%]

SAT: Saturated hydrocarbons

ARO: Aromatic hydrocarbons

POL: Polar compounds (Resins+Asphaltenes)

HC : SAT+ARO (mg HC/g of rock)

TABLE: 1 25/2-12
