3.2 Test summary

DST no. 1

After finishing logging, a gauge ring and a junk basket were run to 1500 m. A 9 5/8" bridgeplug was set at 1410 m, but the plug failed to test. A new plug was set at 1406 m and the plug was tested to 300 bar. A run with 8 1/2" bit and 9 5/8" scraper was performed. The hole was displaced to seawater and flowchecked prior to displacing the hole to 1.24 sg calcium carbonate brine.

Perforation guns were run on the drill pipe, a correlation run with GR/CCl was performed and the well was perforated from 1338.5 m to 1350 m. A prepacked screen was run with a retrievable packer.

A ball was dropped to set the packer but no pressure test was achieved from the annulus side indicating the packer was not set. The packer with the screen was pulled out but got stuck at 908 m. The running tool was sheared out and the running string was pulled out leaving the packer and screen in the hole. The packer was retrieved using the packer retrieving tool, but the bottom of the packer and 43 m of the screen assembly was left in the hole. The top of the fish was located at 1370 m and it was decided that the fish should be left in the hole and to proceed with the test operation.

The back up prepacked screen and the packer were run and the packer was set at 1319 m. A stinger was run inside the screen and HCl was pumped to clean the screens and for injection into the formation.

The test string was run and the landing string was landed in the wellhead. The tubing was displaced to nitrogen cushion and the test valve was opened for initial flow for 10 minutes before it was closed for initial build-up. The drill stem test was performed as follows: clean-up flow, clean-up build-up, main flow and main build-up. During the clean-up build-up period, gauges were run, but they stood up 5 m above the XN-nipple and were rigged down prior to opening up for the main flow.

After terminating the final build-up, the well was killed and flowchecked before the surface equipment was laid down and the test string was pulled out of the hole.

A cement retainer was set at 1310 m and 1.5 m³ cement was dumped on top of the retainer before the stinger was pulled out.

The further plug and abandonment was done according to Chapter 4.

Summary/Conclusion/Recommendation

This report comprises Vitrinite Reflectance data on drillcuttings in Well 7316/5-1 from 660m to 4027m MD RKB, a total of 200 samples.

The analyses are performed by Geolab UK, Cramlington.

I'VE DONE MY BEST BUT I FEAR THAT THE RESULTS ARE NOT VERY GOOD. THE TROUBLE IS THAT THE SEDIMENTS ARE LACKING IN PHYTOCRASTS AND ITS A STRUGGLE TO FIND ANYTHING TO MEASURE. ADDED TO THIS IS THE PROBLEM OF CAVINGS. IN A NORMAL SUCCESSION THE CAVINGS HAVE TO BE FROM MORE THAN 500m ABOVE THE BIT TO BE SIGNIFICANTLY DIFFERENT IN R.O. WITH STILL THE RESISTANCE CHANGES SO RAPIDLY THAT A FEW METERS CAN MAKE A DIFFERENCE.

IN THIS WELL THE RESULTS DOWN TO THE FIRST SILL ARE NOT TOO BAD SINCE THE CAVINGS CAN BE DETECTED BY THEIR LOWER R.O. ONCE PAST THE FIRST SILL THE CAVINGS CAN BE HIGHER OR LOWER AND YOU DON'T KNOW WHAT TO MEASURE.

IF IT'S ANY HELP, MOST OF THE SILLS I HAVE LOOKED AT HAVE AUREOLE / THICKNESS RATIOS OF AROUND 7:1 WITH THE AUREOLE BEING SYMMETRICAL ABOVE AND BELOW. THE R.O. REACHES A MAX OF 5% AT THE CONTACT AND IS ABOUT 2.5% WHERE THE AUREOLE IS TWICE SILL THICKNESS. HOWEVER, THEY ARE VERY VARIABLE AS YOU WILL DISCOVER FROM THE LITERATURE.

IT OBVIOUSLY MAKES A BIG DIFFERENCE IF THE SILLS WERE INTRODUCED SIMULTANEOUSLY OR AT INTERVALS. USING THE HYPOTHETICAL RATIO OF 7:1 ONE WOULD NOT EXPECT TO DETECT THERMAL ALTERATION UNTIL AROUND 2,900m IF THE SILLS HAD BEEN INTRODUCED AT INTERVALS (80m ABOVE THE 11m SILL OR 220m ABOVE THE 31m SILL). IF SIMULTANEOUS, YOU ARE THINKING IN TERMS EQUIVALENT TO 163m SILL INTRODUCED AT ABOUT 3700m (MOST OF THE THICKEST SILLS ARE TO THE BASE) WITH AN AVERAGE WIDTH OF $7 \times 163m = 1150m$. THIS WOULD SUGGEST THE THERMAL ALTERATION EXTENDING UP TO 2550m WHICH IS NOT FAR FROM OUR STARTING POINT.

REYNOLDS,
MILK SONET

Summary/Conclusion/Recommendation

This report comprises the geochemical screening data of Well 7316/5-1 based upon Rock Eval pyrolysis and total organic carbon (TOC) analyses.

All sample preparation and analyses have been carried out by Norsk Hydro's Research Centre in Bergen, Norway.

CONTENTS

Figure 1: Location Map.

Figure 2: Rock Eval/TOC values plotted versus depth.

Table 1: Rock Eval/TOC data.

This report comprises the data from Rock Eval/TOC screening analysis of Well 7316/5-1 from 613m RKB to H027m RKB (TD). Table 1.

Wet drillcuttings for analysis (set 0) were washed with luke warm running water on a 0.025mm sieve, and samples dried overnight at 50°C.

All analyses were performed on finely crushed samples of the 1-2mm bulk fraction after removal of contaminants.

1. INTRODUCTION.

The objectives of this study were to obtain a maturity profile of the well using vitrinite reflectance and colours of spores and pollen. Further, the well was subjected to geochemical screening from the top to TD for source rock identification using RockEval pyrolysis and TOC measurements.

The screening have been carried out over the interval 620 - 4027 mRKB comprising analysis of 447 DC samples. Thirty seven of these samples have been selected for further petroleum geochemical analysis, Table 1.2. The sample

frequency has been 5 m intervals down to 2000 mRKB and 10 m intervals from 2000 mRKB to TD. Vitrinite reflectance analyses have been carried out with approximately 100m intervals from about 1500 mRKB, primarily on DC samples.

Vitrinite reflectance measurements were undertaken by Geolab UK, Cramlington, UK. Stable carbon isotope analysis have been carried out by GeolabNor, Trondheim. Spore and pollen colouration and visual kerogen determination have been carried out by Geochem Ltd, Chester, UK. Screening as well as further petroleum geochemical analysis including interpretation and compilation of this report were completed by Norsk Hydro Research Center, Bergen, Norway.
