SUMMARY

This report contains tables with data from gas chromatographic analysis of headspace and occluded gas from 109 canned cuttings samples from Barents Sea well 7316/5-1. The yields ($\mu\text{l}/\text{kg}$ dry rock) and relative proportions (vol%) of 65 hydrocarbon compounds ranging from C₁ to C₉ are reported.

1. INTRODUCTION

One hundred and nine canned cutting samples from Barents Sea Well 7316/5-1 were received from Norsk Hydro for gas chromatographic analysis of the hydrocarbons contained in the headspace and the occluded gas (C₁-C₉), according to order no. NHT-B44-00522. The cans were received at ambient temperature.

This report contains the results of the gas chromatographic analyses. The hydrocarbon concentrations are expressed as µl gas per kg of dried cuttings (>125µm). The hydrocarbon composition is expressed as volume percent of all recorded hydrocarbons.

2. EXPERIMENTAL METHODS

Headspace gas:

A septum was attached to the can and a sample of the headspace gas was taken for analysis of C₁ - C₉ hydrocarbons.

The gas was analysed on an HP 5880A gas chromatograph fitted with a 50 m x 0.2 mm i.d. fused silica column, coated with 0.5 µm OV-101, and equipped with an FID for hydrocarbon analysis.

Temperature program: - 30°C (2 min.) - 8°C/min. - 170°C (10 min.).

A standard gas sample containing methane, ethane, propane, n-butane, n-pentane, and n-hexane (1000 ppm each) was used for quantification.

The can was then opened and the volumes of the headspace and of the cutting-mud mixture were determined. The cuttings were washed with warm water (30-40°C) on 4.0, 1.0 and 0.125 mm sieves in order to remove the drilling mud, and were then weighed and dried.

Occluded gas:

Prior to drying, an aliquot of the 1-4 mm fraction of each sample was crushed in water for 10 minutes using a gas-tight ball mill. The evolved gas was analysed as described for headspace gas.

Water content:

The water content was determined by drying the fraction >0.125 mm at 35°C for at least 24 hours. It is assumed that this water content is not significantly different from the one of the 1-4 mm fraction.

3. COMMENTS ON SAMPLES AND ANALYTICAL DATA

The wet cutting samples were received in pressure-lid cans of 1 l volume. Since the samples had been stored at ambient temperature, a secondary modification of the gas composition by microbial activity cannot be completely ruled out.

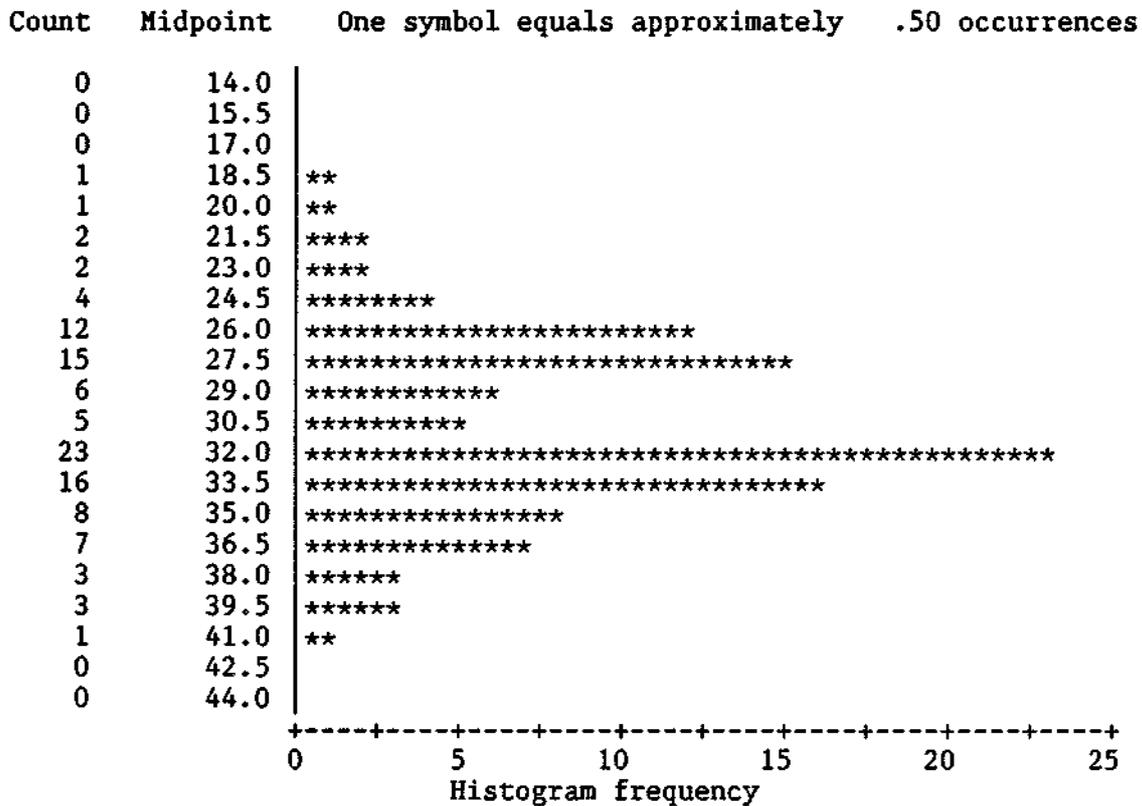

Paint flakes were observed in the sample from 1290 m.

The samples from 3000 m, 3030 m, 3045 m, 3060 m, 3135 m, 3165 m, 3420 m and 3465 m did not contain excess water, although only one metal can (3465 m) showed an obvious leak. The gas data from these samples, particularly those for the headspace gas, should be considered with great caution, although the measured water contents of these sediments are within the normal range.

Significant concentrations of an unidentified compound, coeluting with 2-methyloctane, were detected in a number of samples. This compound may be a contaminant (from the drilling mud?), as it was particularly prominent in the headspace fractions from the top and bottom sections of the well where the gas chromatograms showed no other significant peaks in the C₈-C₉ range. Because of its dubious nature this compound was not included in the tables.

Gas yield and composition are reported with two decimals. This does not reflect a particularly high precision of the data, but shall enable the calculation of compound ratios at low concentrations.

1 INNLEDNING

3 gassprøver; dykkeflaske, RFT 1350 m og flaske 3610A 1338.5 - 1350.0 m MD RKB samt 27 headspacebokser (canned cuttings) fra brønn 7316/5-1 er mottatt og analysert i løpet av september, oktober og november 1992.

C₁ - C₅ og CO₂ er kvantifisert. ¹³C/¹²C isotopforholdet av C₁ - C₄ er bestemt i alle prøver hvor konsentrasjonen av enkeltkomponentene har vært tilstrekkelig. I tillegg er D/H isotopforholdet av metan bestemt i flertallet av prøvene.

2 ANALYSEPROSEDYRER

Gassprøvene er kvantifisert gass-kromatografisk på en Porapak QS kolonne og varmetråds-/flammeionisasjon-detektor. Headspaceboksene er ristet på ristemaskin i ca. 2 timer før 1 ml av headspacegassen er samlet med sprøyte for kvantifisering. Deteksjonsgrenser for bestemmelse av hydrokarboner er 0.01 µl/ml (10 ppm) og 0.01 µl/ml (100 ppm) av CO₂.

For isotopbestemmelser er ca. 20 ml av gassprøvene separert gass-kromatografisk, og de forskjellige hydrokarbon komponentene er forbrent i individuelle CuO ovner ved 850°C. Forbrenningsproduktene CO₂ og H₂O er samlet og separert ved hjelp av ulike kjølefeller. CO₂ opprinnelig tilstede i prøvene er samlet direkte etter separasjonen for massespektrometrisk analyse.

Vann dannet ved forbrenningen av metan er redusert med Zn i kvarts ampuller for å danne hydrogen for isotopbestemmelser.

Isotopbestemmelsene er foretatt på Finnigan MAT 251 and Finnigan Delta massepektrometere. IFEs verdi på NBS 22 er $29.77 \pm .06\text{‰}$ PDB.

3 RESULTATER

Tabell 1 viser volumsammensetningen av RFT - DST gassprøvene. Resultatene er normaliserte. Tabell 2 viser isotopsammensetningen av de samme gassprøvene. Tabell 3 viser konsentrasjonen av de ulike komponentene, tabell 4 normalisert volumsammensetning og tabell 5 isotopsammensetningen av headspacegassen.

Usikkerheten i $\delta^{13}\text{C}$ verdien (bestemt ved gjentatt analyse av standard gass) er $\pm 0.3\text{‰}$ PDB og inkluderer all analysetrinn. Tilsvarende usikkerhet i δD verdien er $\pm 5\text{‰}$ SMOW.

nd i tabellene indikerer at disse resultatene ligger under deteksjonsgrensene eller at det har vært for lite for isotopbestemmelse.

På grunn av lave konsentrasjoner er $i\text{C}_4$ og $n\text{C}_4$ fra gassprøvene og headspacegassen isotopbestemt i en fraksjon. $\delta^{13}\text{C}$ verdien av C_4 fra gassprøve 1338.5 - 1350.0 m MD RKB (markert med * i tabell 2) er svært lett og skyldes trolig at det er analysert på en svært liten gassmengde og ikke naturlige forhold.

To av headspace prøvene (1365m og 3150m, markert med ** i tabell 5) skiller seg ut fra de resterende med hensyn til karbonisotopsammensetningen av metan. Trolig skyldes dette at disse to prøvene inneholdt svært lite metan (lav konsentrasjon i headspacegassen), og tidligere analyser har vist at bestemmelser av svært små gassmengder ofte gir en for tung isotopsammensetning. Bakterier i headspaceboksen (mangelfull tilsetning av baktericid ved prøvetaking) vil også medføre en anrikning av den tunge isotopen.

Resultatene er plottet mot dybde i figurene 1 - 5. Figur 6 og 7 viser isotopdata plottet i diagram etter Schoell (1983).

ANALYTICAL PROGRAM

The samples are prepared, extracted, fractionated and analysed for SAT-biomarkers by GC/MS at Hydro Research Centre, Bergen.

The analysed samples and analytical quality are listed below.

The samples which are labeled 'ST.....' represent the internal lab reference sample. This sample is included in all analytical series and reflects the analytical repeatability.

Depth start int	Depth end int.	Sample type	Lith.	Job #	Result GC/MS	Result GC/MS-Q

EXPERIMENTAL: GC/MS-Q

Analytical method:	MQSIA version Dec.1992 (Magnet-Quadropole Saturated-biomarkers 1000-resolution version-A)
	Gas chromatographic and linked magnet-quadropole mass spectrometric analysis of saturated biomarkers.

Detected compounds:	<p>Detection of pre-selected groups of saturated (SAT)-biomarkers in saturated or mixed saturated/aromatic group type fractions.</p> <p>The relative distribution of the detected SAT-biomarkers are presented in bargraphs as measured peak heights and normalised to the most abundant compound.</p> <p>This semi-quantitative presentation is strictly related to the analytical method. The concentration/response ratio is not necessarily comparable between different type of compounds. A quantitative comparison based on the presented biomarker distributions are restricted.</p> <p>Sample information, tabulated peak data and normalised bargraphs with abbreviation codes and identities of the detected SAT-biomarkers are reported.</p>
----------------------------	--

Method description:	<p>The analytical parameters are listed on the following pages.</p> <p>The parent ions of pre-selected SAT-biomarker compounds are mass separated by the magnet mass spectrometer. These mass selections are based on the traditional method of Voltage Selected Ion Recording (VSIR). The mass resolution is $R(10\%) = 1000$ or equivalent to a mass window of approximately 0.4 mass units.</p> <p>The transition from parent to daughter ions are induced by the energy reduction prior to the quadropole mass spectrometer.</p> <p>Pre-selected daughter ions are detected by selective quadropole mass detection. The mass window is approximately 2 mass units.</p>
----------------------------	---

Detection parameters for pre-selected, induced parent-daughter ion transitions:

Experiment method: MQS1A (Dec. 1992)	Analytical function: #1 of 2	Detected retention time interval: 0:20:00 - 0:51:50

Analytical method: MQS1A (version Dec.1992)

EXPERIMENTAL: GC/MS

Analytical method:	MSD_S_A version March 1993 (Mass Spectrometric Detection Saturated-biomarkers version A)
	Gas chromatographic and linked quadropole Mass Spectrometric (MS) analysis of Saturated biomarkers.

Detected compounds:	<p>Detection of pre-selected groups of saturated biomarkers, by MS, in saturated group type fractions.</p> <p>The MS-detected SAT-biomarkers are presented in mass chromatograms and normalised to the most abundant compound.</p> <p>This semi-quantitative presentation is strictly related to the analytical method. The concentration/response ratio is not necessarily comparable between different type of compounds. A quantitative comparison based on the presented biomarker distributions are restricted.</p>
----------------------------	---

Method description:	<p>The samples are analysed according to the standard lab procedures for SAT-biomarker MS-detection. Analytical conditions are indicated on the next page.</p> <p>The MS-detection is based on low resolution selected ion recording of a standard selection of common fragment ions for SAT-biomarkers. The mass window is approximately 1 mass units.</p> <p>The listed masses are reported as normalised fragmentograms (mass chromatograms):</p> <p>m/z 191.2 => Common fragment ion for terpanes</p> <p>m/z 177.2 => Common fragment ion for demethylated-terpanes</p> <p>m/z 217.2 => Common fragment ion for steranes</p> <p>m/z 218.2 => Abundant ion of 5α(H),14β(H),17β(H)-steranes (indicating the carbon number distribution)</p> <p>m/z 231.3 => Common fragment ion for methylated-steranes</p> <p>m/z 259.3 => Abundant ion of dia-steranes</p> <p>m/z 85.1 => Common fragment ion for alkanes</p>
----------------------------	--

Detection parameters for pre-selected, common fragmentation-ions:

Experiment method: MSD_S_A (March. 1993)	Detected retention time interval: 0:10:00 - 0:65:00
---	--

Cycle time: 1000 ms

Detected groups of compounds	Inter-channel time, ms	Common fragment ions, m/z	Channel time, ms

Alkanes	15	85.1	85
Demethylated-terpanes	15	177.2	85
Terpanes	15	191.2	85
Methylated-terpanes	15	205.5	85
Steranes	15	217.2	85
Favourized 5 α (H),14 β (H),17 β (H)-steranes	15	218.2	85
Methylated-steranes	15	231.3	85
Favourized dia-steranes	15	259.3	85
D2-deuterated-terpanes (int.std.)	15	193.3	85
D4-deuterated-steranes (int.std.)	15	221.2	85

Automatic sampler HP-7673

Splitless injection for 1 min./split 1:50
 Injected sample: 1 μ l iso-octane
 Syringe wash: 6 times in 5 μ l iso-octane
 Injector temperature: 200 C

Gas chromatograph HP-5890/II

Helium carrier gas, approx. 1 ml/min, constant flow 14 psi at 70 C
 310°C 20 min.
 Oven temperature ramp 4°C/min.
 70°C 2 min.
 FID 290°C

Capillary column, methyl silicone phase, 20 mm, 0.33 mm, 25 m
 20 mm, 0.33 mm, 25 m

Heated transfer line

Lines: 310°C

HP-5971 (MSD), Hewlett Packard

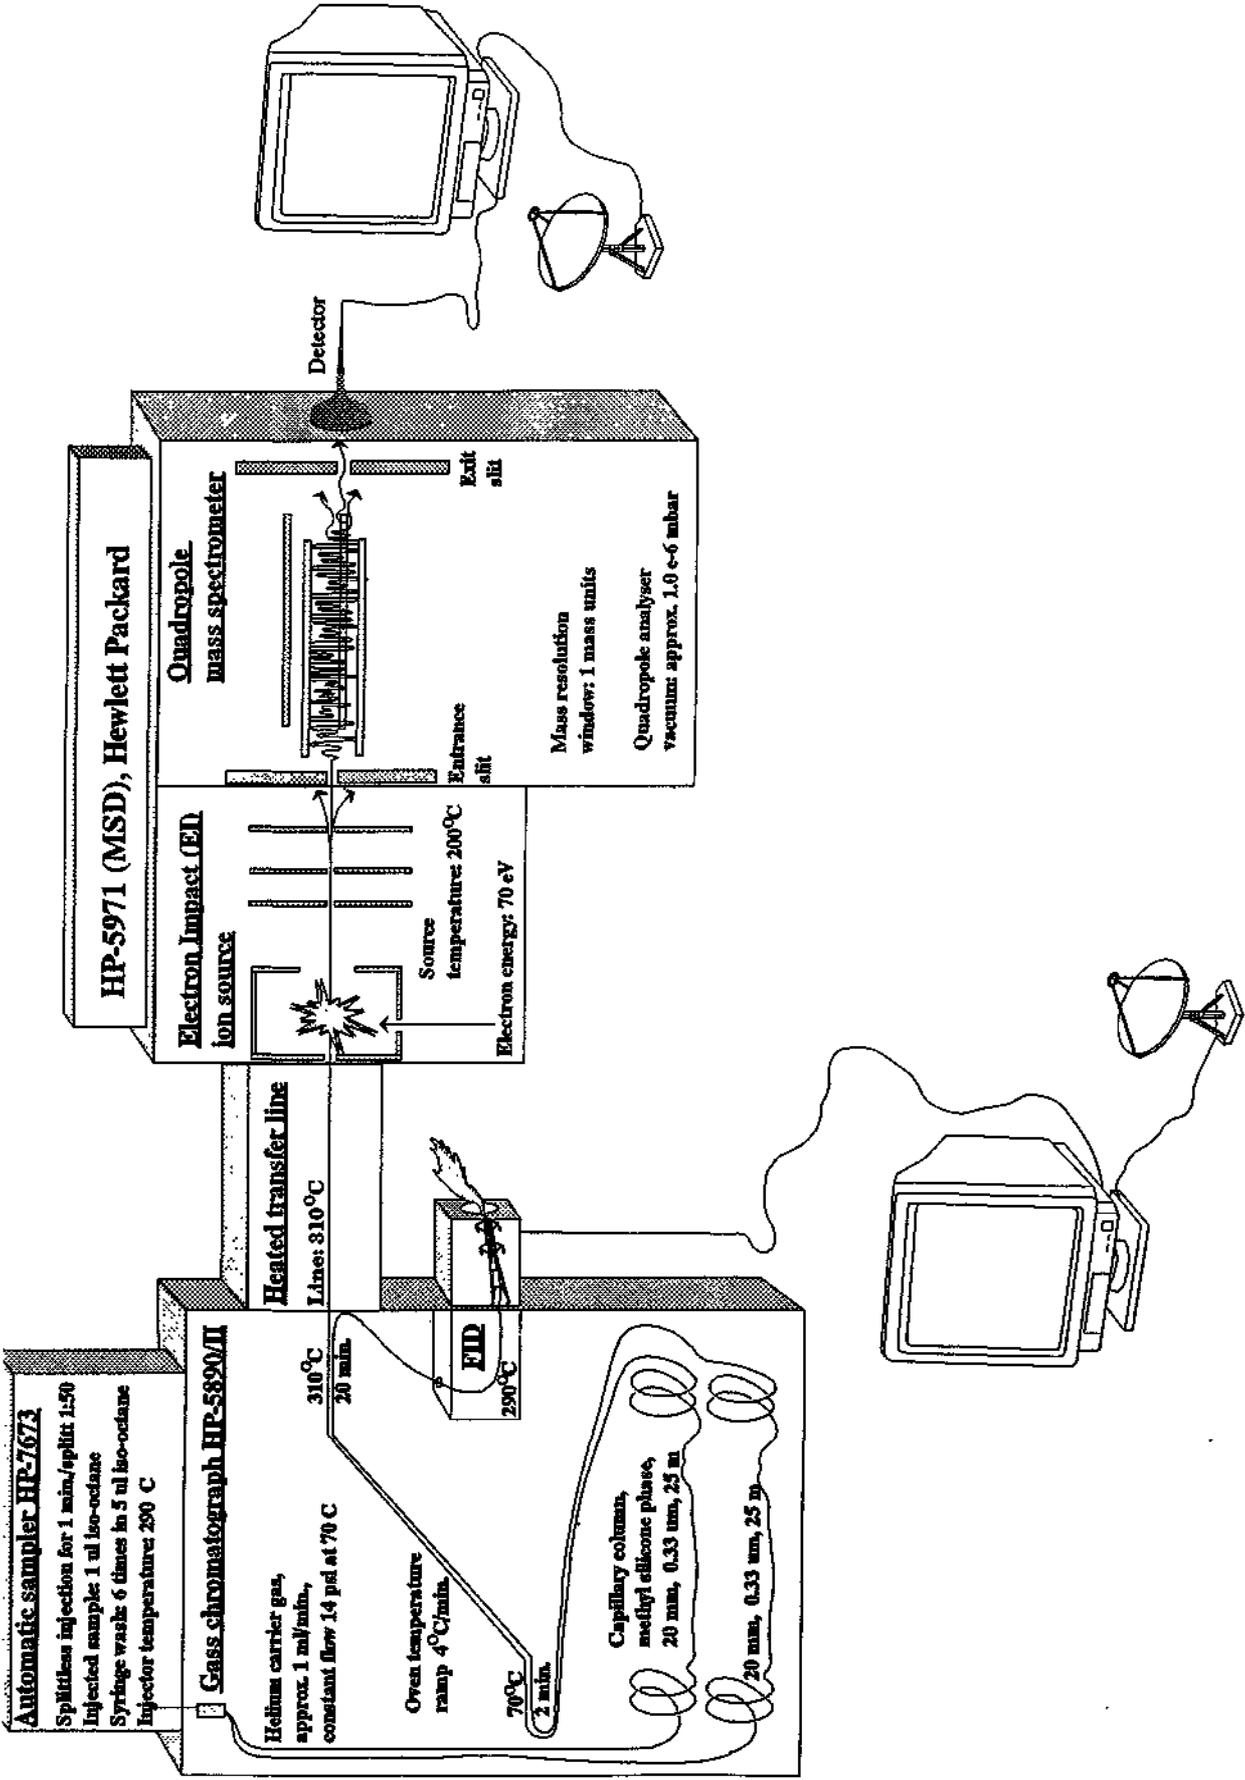

Electron Impact (EI) ion source

Source temperature: 200°C
 Electron energy: 70 eV

Quadrupole mass spectrometer

Mass resolution window: 1 mass units
 Quadrupole analyser vacuum: approx. 1.0×10^{-6} mbar

Detector

RESULTS

The data are presented by increasing depths and accordingly:

- **Detected compounds and abbreviations**
- **Bargraphs of GC/MS-Q detected SAT-biomarker distributions**
- **Mass chromatograms of GC-MS detected SAT-biomarkers**

- **The peak data from the GC/MS-Q detection of all samples are listed in a separate table.**

The information from the sample preparation and additional analytical data are presented in:

Petroleum Geochemistry Well 7316/5-1, Norsk Hydro report R-060541, March 1993.

Detected compounds and annotations

According to 'The Norwegian Industry Guide to Organic Geochemical Analysis', Feb.1993, the identity of each biomarker compound should be abbreviated as listed below.

The old codes will be reported until the computerized data handling procedures are updated.

The present analytical method will only report data which are listed as 'Old code'.

Old code	New code	Detected parent/ daughter ion, m/z	Identification
Deuterium labeled internal standards (if added):			
D4-C21	4D21a	292.30 -> 221.22	D4-pregnane (sterane)
