

**Well:** 25/6-3 Urd

## **DRILLING FLUIDS PROGRAM**

**Rig:** Byford Dolphin

## **Standard geochemical study of well 25/6-3 (Urd prospect)**

## **1 Summary**

Two samples with high S1 values were found to be contaminated with Marcol 82, a refined oil used to drill plugs on the rig. Marcol 82 contains a large hump centred on n-C23, but it also has its own suite of biomarkers which are different to both the indigenous compounds and those in the drilling muds from the rig.

The Sildril mud as obtained from the drilling company was found to be free of organic additives, but the sample collected from the rig prior to drilling, plus the three mud samples collected during drilling, all contained two major components (alkenes?) plus a series of minor peaks including n-alkanes and oil window-mature biomarkers. The biomarkers from the drilling mud appear to have contaminated the sand sample from the Hermod Formation analysed by GCMS.

Thus no migrated hydrocarbons were identified, whilst in situ hydrocarbons were present in low abundance in the rock samples. The latter were also contaminated either by Marcol 82 (highly contaminated in two instances) or organics in the drilling mud (low level). Both the Marcol 82 and the drilling mud contain their own suite of biomarkers, which differ to those identified as being in situ in the shale.

### **3 Analytical programme**

The full analytical programme is given in the Appendix, but Table 1 summarises the depth, formation and lithology of the samples analysed. All analytical work was carried out by Geolab Nor in accordance with the Norwegian Industry Guide to Organic Geochemical Analyses, 3rd Edition. The shales were analysed as controls for the sands, in order to help assess the relative contribution in the sands of hydrocarbons from local shales versus migrated petroleum. In addition, five mud samples were analysed (Table 1). These were a mud from the drilling company laboratory, a mud from the rig prior to use (referred to as "mud prior" in the Appendix), and three muds collected during drilling.

The rock samples were analysed by TOC and Rock Eval, whilst all samples were extracted (except for the Marcol 82 oil which was analysed as a whole oil) and run as whole extract/oil GCs. Four samples (one shale, one sand, one mud and the Marcol 82 oil) were analysed by whole extract/oil GCMS (Table 1).

### **4 Results and Discussion**

All the data referred to here are provided in the Appendix.

#### **4.1 Mud samples**

The mud sample from the laboratory gave an entirely featureless gas chromatogram, indicating no organic additives were present. However, GC of both the "mud prior" to drilling from the rig, and the three muds from the well, revealed two major peaks (probably alkenes based on GCMS) as well as a series of minor peaks including what appears to be a homologous series of n-alkanes (Fig. 2). This indicated quite clearly that organic components were added to the mud, presumably on the rig, after it left the laboratory.

## Comments

Samples of core-plugs, sidewall cores and cuttings from well NOCS 25/6-3 over the interval 2068.60 - 2349 m were received for analysis. The cuttings samples were grouped into a more limited number of composite samples according to Statoil's instructions (see below). The resulting sample set was subjected to normal screening analyses, followed by solvent extraction with extract GC. These analyses curtailed the program, revealing either hydrocarbons of no economic interest or contaminant hydrocarbons. The origin of the latter was unknown, and subsequently additional samples of muds were analysed, the virgin mud (Sildril) having been already been analysed prior to drilling. A sample of oil used during the plugging process (Marcol-82) was also provided and requested analysed. A limited number of analysed core/cuttings samples were re-picked and re-analysed in order to eliminate the Geolab laboratory as the source of the contamination, which they did. Finally, limited whole-extract GC-MS was performed on two rock samples and one mud sample plus the Marcol oil.

Composite cuttings samples:

2277m = 2274 + 2277m

2286m = 2280 + 2283 + 2286m

2295m = 2289 + 2292 + 2295m

2334m = 2328 + 2331 + 2334m
