North Sea, Norwegian Sector,  
Albuskjell 2/4-9X Well. Crude  
Oil Characterization  
DAM-28-75

C. P. Kaiser, Manager  
Phillips Petroleum Company - Norway  
Akeragaten 45  
N-Oslo 1, Norway

Attention: C. S. Saunders

Geochemical characterization has been completed on crude oil and natural gas recovered from Danian Limestone during production tests of the Albuskjell 2/4-9X Well, Norwegian Sector, North Sea. These samples include three companion sets taken in DST Nos. 1, 2, and 3, which tested intervals between 3226 and 3368 meters (10,584-11,050 feet); and one gas sample collected from the manifold at the rig floor before reversing out DST 5, which tested an interval between 3222 and 3225 meters (10,570-10,580 feet). The samples were transmitted from the Stavanger office under R. M. Thompson cover letter ASL/eb-69-75.

Conclusions and interpretations resulting from this study are as follows:

1. The crude oil samples are paraffinic with a density ranging between 0.7955 and 0.8050 (API gravity 46.3 - 44.2), a sulfur content of only 0.05 weight per cent, and nitrogen present in a range from 0.05 to 0.11 weight per cent. The asphaltic fraction is generally less than 5.0 weight per cent.
2. The crude oils originated from a common source rock facies which accumulated in a marine environment that sometimes approached brackish conditions. On the basis of previous studies, Paleocene shales are indicated to be the source of Danian-Cretaceous oils in this area.
3. The lone gas sample is wet, that is, contained ethane and higher molecular weight hydrocarbons. The gas is 68 per cent methane, 11 per cent carbon dioxide, about 7 per cent ethane, and 3 per cent propane. The remainder is made up of small amounts of heavier hydrocarbons, none of which constitute over one mol per cent.

These conclusions and interpretations are based on data presented in Tables I through V and Figures 1 through 4.

FIGURE 2. Odd-Even Predominance (OEP) as a function of carbon number for crude oil recovered from Danian Limestone in the Albuskjell 2/4-9X Well, Norwegian Sector, North Sea.

U, Y, W

FIGURE 3. Concentration of n-alkanes by carbon number for Crude Oil recovered from Danian Limestone in the Albuskjell 2/4-9X Well, Norwegian Sector, North Sea.

FIGURE 4. RATIOS OF COMPONENTS

for pairs not easily fractionated in the earth for crude oils recovered from Danian Limestone in the Albuskjell 2/4-9X Well, Norwegian Sector, North Sea. Unique character of the three nearly coincident curves will be cataloged for future use in correlation of North Sea petroleum. Weight percentages of respective components are listed in Tables II through IV.
