Dear John:

Please find enclosed two copies of our report EPR-E.WA17.81, entitled:
"Paleontological study of the Esso 25/10-5 well, between 1397.5m and 2007m,
offshore Norway" by R. Jan du Chêne and M. Pons.

Stratigraphic tops have been determined between the Early Oligocene to Late
Eocene and the Middle to Early Paleocene.

If you need further information, do not hesitate to contact us.

Sincerely yours,

Jorge Ferrer

PALEONTOLOGICAL STUDY OF THE ESSO 25/10-5 WELL,
BETWEEN 1397.5m AND 2007m, OFFSHORE NORWAY

by

R. Jan du Chêne and M. Pons

INTRODUCTION

The paleontological study of the Esso 25/10-5 well is based on SWC samples situated between 1397.5m and 2007m; 26 of them were studied for palynology and 46 for micropaleontology.

The following stratigraphic tops have been determined:

<u>Depth (m)</u>	<u>Age</u>	<u>Palynology</u>	<u>Micropaleontology</u>
1397.5	Early Oligocene to Late Eocene	VII	Arenaceous forams
1443.5	Middle Eocene	V	
1746	Early Eocene	III	
1756.5			<i>Coscinodiscus</i> sp. 1
1858.5	Late Paleocene	II	
1877	Late to Middle Paleocene	IB	<i>Bolivinopsis spectabilis</i>
1949	Middle to Early Paleocene	IA2	<i>Globigerina triloculinoi-</i> <i>des</i> , <i>Globigerina</i> spp., <i>Glo-</i> <i>borotalia pseudobulloides</i>

STRATIGRAPHY

At 1397.5: Early Oligocene to Late Eocene

This SWC sample contains a good dinoflagellate assemblage from palynozone VII with *Areosphaeridium diktyoplokus*, *A. arcuatum*, *Kisselovia coleothrypta*, *Svalbardella* sp. and *Deflandrea phosphoritica*.

The microfauna is represented by *Trochammina globigeriniformis*, *Ammodiscus incertus*, *Haplophragmoides eggeri*, *Karreriella pokornyi*, *Cyclammina* sp. and *Glomospira charoides*.

At 1443.5: Middle Eocene

The presence of *Wetzelia pachyderma* indicates the palynozone V for this sample.

In this SWC *Ammobaculites* sp. 11 and *Bathysiphon discreta* are observed.

At 1735.4: indeterminate

This SWC sample shows a very poor assemblage of pollen.

From 1746 to 1851.5m: Early Eocene

This interval is characterized by the presence of *Deflandrea speciosa*, zone III index dinoflagellate.

At 1756.5m appears *Coscinodiscus* sp. 1.

In this unit, besides *Coscinodiscus* sp. 1, we have also observed arenaceous foraminifera, *Coscinodiscus* sp. 2 and *Triceratium* sp. 1.

At 1858.5m: Late Paleocene

Apectodinium hyperacanthum is recorded at 1858.5m and indicates the palynozone II.

The microfauna is represented by rare *Coscinodiscus* sp. 1 and arenaceous foraminifera.

From 1877m to 1946m: Late to Middle Paleocene

Alisocysta circumtabulata defines the palynozone IB.

Bolivinopsis spectabilis appears at 1877m.

In this interval, microfossils are essentially arenaceous foraminifera.

From 1949m to 2007m: Middle to Early Paleocene

The first occurrence of *Palaeoperidinium pyrophorum* is recorded at 1949m. This index dinoflagellate indicates the palynozone 1A2.

At 1949m, we noted *Globigerina triloculinoides*, *G.* spp. and *Globorotalia pseudobulloides*, forms of an Early to Middle Paleocene age.

The arenaceous foraminifera are always present.
