REPORT ON NL SPERRY-SUN GAUGES RUN IN WELL 30/2 - 1 DST 3

Three Sperry-Sun MK 3 and one Sperry-Sun MK 1 MRPG Gauges were run into well 30/2 - 1 prior to DST 3, these were gauge numbers: 0054, 0125 (MK 1), 0092, and 0016. The MK 3 gauges had 10,000 psi transducer sections, the MK 1 gauge had a 12,000 psi Bourdon tube element. The gauges had varta high temperature silver oxide batteries.

When the gauges were retrieved after the test it was found that gauge 0092 had failed. When this gauge was examined in Stavanger it was found that the gauge would work normally at low temperature but as the temperature increased above 240⁰ F, a short circuit developed between the gauge section and the battery pack, a problem not experienced before on any type of Sperry-Sun gauge.

Gauge 0016 had failed to operate due to fluid from the battery pack leaking into the gauge itself, causing the tape advance motor and the tape to seize up.

MK 1 Gauge 0125 was set on the wrong time sample mode and therefore only recorded the static period and the first hour of the flow period.

Gauge 0054 was found to have drifted from its original calibration. When this gauge was returned to Stavanger a check calibration was carried out, and the gauge was found to be reading +343 psi at 10,000 psi, + 323 psi at 9,000 psi, +303 psi at 8,000 psi, +261 psi at 7,000 psi. This calibration was then applied to the data from gauge 0054 for DST 3.

NB Analysis of the data for DST 2 revealed that gauge 0054 was developing a transducer fault during the previous test.
