Description

Type	Text	Date updated
Development	Snøhvit is a field in the central part of the Hammerfest Basin in the southern part of the Barents Sea. The water depth is 310-340 metres. Snøhvit was discovered in 1984, and the plan for development and operation (PDO) was approved in 2002. Snøhvit was the first field development in the Barents Sea. The field includes the Snøhvit, Albatross and Askeladd structures and has been developed in multiple phases. The development includes several subsea templates. Two well slots are used for CO2 injection. The production started in 2007. A PDO exemption for Snøhvit North was granted in 2015. An amended PDO for onshore gas compression and full electrification was approved in 2023.	14.12.2023
Reservoir	Snøhvit produces gas with condensate from Lower and Middle Jurassic sandstone in the Nordmela and Stø Formations. The reservoirs are at a depth of 2300 metres and have moderate to good quality.	14.12.2023
Recovery strategy	The field is produced by pressure depletion.	28.02.2023
Transport	The well stream, with natural gas, CO2, natural gas liquids (NGL) and condensate, is transported in a 160-kilometre pipeline to the liquid natural gas (LNG) processing facility at Melkøya near Hammerfest. The CO2 is separated and returned to the field by pipeline for injection into the aquifer (Stø reservoir). LNG, liquid petroleum gas (LPG) and condensate are shipped to the market.	28.02.2023
Status	The production from Snøhvit is in the plateau phase. Since production started, additional production wells have been drilled in different structures. Work is ongoing to prepare for onshore compression and electrification in order to significantly reduce CO2 emissions from the onshore facility at Melkøya.	14.12.2023

Investments (expected)

The operators future investments related to the reservers from 2023 [mill NOK 2023-kroner]. The stated investment estimate has not been corrected for possible investment sharing.	24629
