Description

Type	Text	Date updated
Development	Nordøst Frigg is a field in the central part of the North Sea. The water depth is 110 metres. The field was discovered in 1974, and the plan for development and operation (PDO) was approved in 1980. Nordøst-Frigg was developed with a seabed template with six wells and was remotely operated from the Frigg field using a control tower. The control tower consisted of a deck and a 126-metre-high steel structure attached to a concrete foundation. The production started in 1983.	09.12.2023
Reservoir	Nordøst Frigg produced gas from sandstone of Eocene age in the Frigg Formation. The reservoir is at a depth of 1950 metres. It has pressure communication with the reservoir on the Frigg field via the aquifer.	09.12.2023
Recovery strategy	The field was produced by pressure depletion.	28.02.2023
Transport	The well stream was sent via pipeline to Frigg (TCP2) for further processing before export through the Frigg Norwegian Pipeline to St Fergus in the UK.	28.02.2023
Status	Nordøst Frigg was shut down in 1993, and the facility was removed in 1996. The development of the Yggdrasil area may provide an opportunity for a redevelopment of the field.	09.12.2023
