Description

Type	Text	Date updated
Development	Heimdal is a field in the central part of the North Sea. The water depth is 120 metres. Heimdal was discovered in 1972, and the initial plan for development and operation (PDO) was approved in 1981. The field was developed with an integrated drilling, production and accommodation facility with a steel jacket. The production started in 1985. When the Heimdal riser gas facility (Gas Centre) came into operation, Heimdal also became a hub for dry gas transport from Oseberg, in addition to processing production from fields such as Atla, Skirne, Vale, Valemon and Huldra.	09.12.2023
Reservoir	Heimdal produced gas and some condensate from sandstone of Paleocene age in the Heimdal Formation. The reservoir is in a massive turbidite system at a depth of 2100 metres and has good quality.	09.12.2023

Recovery strategy	The field was produced by pressure depletion.	28.02.2023
Transport	Gas from Heimdal was transported in Statpipe via the Draupner and Ekofisk fields to continental Europe. When the Heimdal Gas Centre was established, a new gas pipeline was connected to the existing gas pipeline from the Frigg field to the Shell-Esso Gas and Liquid (SEGAL) terminal at St Fergus in the UK. Condensate was transported by pipeline to the Brae field in the UK sector and further to Cruden Bay in the UK.	09.12.2023
Status	The production from Heimdal ceased in 2020. Heimdal was used as a gas processing centre until mid-2023. Decommissioning of the facilities must be completed by the end of 2028.	09.12.2023
