**Beskrivelse**

## Sognefjord Formation

### Name

After a fjord on the west coast of Norway, adjacent to the type area in Quadrant 31.

### Well type section

Norwegian well [31/2-1](#) (Shell) from 1440 m to 1531.5 m, coord N 60°46' 19.16", E 03°33'15.87", ([Fig 3.21](#)).

### Well reference section

None at present.

### Lithology

The formation consists of sandstones and sands, grey-brown in colour, medium to coarse grained, well sorted and friable to unconsolidated. Locally the formation is weakly micaceous with minor argillaceous and carbonaceous beds. Bioclastic material and occasional cemented bands occur locally.

### Boundaries

The Sognefjord Formation has a gradational lower boundary, due to the interdigitation of sandstones with the siltstones which form the upper part of the [Heather Formation](#). The base is chosen immediately below the first continuous sandstone, often shown by reduction in gamma ray intensity. The formation has a homogenous "blocky" log motif in the lower half. The upper half comprises several cycles displaying "funnel-shaped" gamma ray log motifs coincident with coarsening upward sequences. The top of the formation is marked by the distinct lithological break into claystones or shales, which in the type well are the overlying [Draupne Formation](#).

### Distribution

The formation has only been clearly recognized in the [Troll Field](#) area, where it is the major reservoir interval.

### Age

Oxfordian to Kimmeridgian/Volgian.

### Depositional environment

The formation was deposited in a coastal-shallow marine environment.
