| <b>Tor Formation</b>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Name</b>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Named by Deegan & Scull (1977) from the <a href="#">Tor Field</a> in Norwegian blocks 2/4 and 2/5. Tor was a son of Odin, and one of the principal gods of Norse mythology.                                                                                                                                                                                                                                                                              |
| <b>Well type section</b>                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Norwegian well <a href="#">1/9-1</a> from 3312 m to 3104 m, coordinates N 56°24'05.07", E 02°54'06.49" ( <a href="#">Fig 5.29</a> ). Cored through the formation.                                                                                                                                                                                                                                                                                        |
| <b>Thickness</b>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| The formation is 474 m thick in the type well, 262.5 m in 22/1-2A, 143 m in 29/25-1 and 208 m in <a href="#">1/9-1</a> . In the Norwegian sector, seismic interpretation indicates that the thickness of the formation may exceed 600 m in the northwestern part of the Central Trough.                                                                                                                                                                  |
| <b>Lithology</b>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| In the type well the formation consists of white to light grey, tan to pink, hard, chalky limestones. The formation is generally homogenous, or consists of alternating white, grey or beige, moderately hard to very hard, rarely soft, mudstones or wackestones, rarely packstones, chalks, chalky limestones or limestones. Occasional fine layers of soft grey-green or brown marl occur and also rare stringers of grey to green calcareous shales. |
| <b>Basal stratotype 1)</b>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| The lower boundary is generally marked by an upward change to a more constant lower level of gamma-ray response, and also by higher velocity ( <a href="#">Fig 5.24</a> ).                                                                                                                                                                                                                                                                               |
| <b>Characteristics of the upper boundary</b>                                                                                                                                                                                                                                                                                                                                                                                                             |
| The upper boundary is marked by the end of the more constant low gamma-ray response with a return to a higher and more irregular gamma ray and a lower velocity in                                                                                                                                                                                                                                                                                       |

the overlying [Ekofisk Formation \(Fig 5.24\)](#). The upper boundary represents an unconformity with a submarine hardground along the Lindesnes Ridge, and a change of deposition to clay-rich chalks or minor shales ([Fig 5.28](#)).

### **Distribution**

The formation is present throughout the central North Sea ([Fig 5.32ab](#)). In the Norwegian sector it is very thin or absent on the Lindesnes Ridge and the Utsira High.

### **Age**

Late Campanian to Maastrichtian.

### **Depositional environment**

Open marine with deposition of calcareous debris flows, turbidites and autochthonous periodites.

### **Remarks**

In general the formation shows an upward increase in the intensity and thickness of allochthonous beds. 16 major correlative allochthonous units are recognised within the Central Trough area (Hatton 1986). The sequence of single or stacked mass flows with autochthonous periodite facies enables three separate members to be distinguished (d'Heur 1984, Hatton 1986, ([Fig 5.24](#), [5.29](#), [5.30](#), [5.31](#))). The semi-regional distribution pattern of the allochthonous units shows that this subdivision is not valid throughout the area of the chalk facies.

### **Lower member of the Tor Formation**

The sequence is dominated by autochthonous periodite deposits interrupted by single or stacked minor debris flows. The sequence is present in Norwegian wells [2/5-1](#) from 3475 m to 3235 m, [1/3-1](#) from 3828 m to 3447 m and [2/4-5](#) from TD to 3283 m.

### **Middle member of the Tor Formation**

This unit shows a marked increase in slumps, slides, and stacked and single debris flows relative to intervening minor autochthonous beds. The unit is present in Norwegian wells [2/5-1](#) from 3235 m to 3192 m, [1/3-1](#) from 3447 m to 3411 m, [2/4-5](#) from 3283 m to 3237 m and [1/9-1](#) from 3168 m to 3137m.

### **Upper member of the Tor Formation**

This unit generally consists of high porosity, homogenous chalks which represent stacked sequences of, often slumped, debris flows. The unit is present in Norwegian wells [2/5-1](#) from 3192 m to 3132 m, [2/4-5](#) from 3237 m to 3164m and [1/3-1](#) from 3411 m to 3354m.
