## Beskrivelse

### Cromer Knoll Group

#### Name

From the Cromer Knoll buoy in the southern North Sea. Named by Rhys (1974) in the southern North Sea and extended in use to the northern North Sea by Deegan and Scull (1977). The group as now used off mid-Norway corresponds to the informal Finnvær Group (H3).

#### Type area

The type area is in the southern North Sea. Rhys (1974) used UK well 48/22-2 to illustrate a typical section of the group, and Deegan & Scull (1977) used UK wells 29/25-1, 22/1-2A and 3/29-1, and Norwegian well [2/11-1](#). In the North Sea the following Norwegian wells have been used to illustrate local developments of the group: [2/6-2](#), [2/7-15](#), [2/11-1](#), [7/3-1](#), [17/11-2](#), [34/10-18](#), [35/3-4](#), [35/3-5](#), [31/6-3](#), [24/12-2](#) and [17/4-1](#); the Danish well DK1-1 has also been used.

In the Norwegian Sea the following wells are used to illustrate the local development of the group: [6506/12-4](#) (Statoil), coordinates 65°12'46.97"N, 06°43'30.37"E, from 3855 m to 3132.5 m and [6506/12-1](#) (Statoil) coordinates 65°10'07.58"N, 06°43'44.07"E, from 3835 m to 3175 m ([Fig 4.25](#), [4.26](#)) The base of the [Lyr Formation](#) marks the lower boundary of the Cromer Knoll Group on Halten Terrace. In basinal areas to the west the [Lange Formation](#) is expected to rest directly on shales of the [Viking Group](#) ([Fig 4.5](#)) ([Fig 4.6](#)).

#### Thickness

The thickness of the group varies considerably since the sediments were deposited in response to an active Late Jurassic tectonic phase. In the Viking Graben, the Åsta

Graben and locally in the Central Trough the thickness is often more than 600 m, gradually thinning towards the basin margins. The group is 667 m thick in Norwegian well [2/11-1](#) and 643 m thick in Norwegian well [17/11-1](#). Seismic data indicate that the group is thickest in the Sogn Graben, where it probably reaches up to 1400 m. In the Norwegian Sea 722.5 m are recorded in well [6506/12-4](#) and 660 m in well [6506/12-1](#).

### Lithology

The Cromer Knoll Group consists mainly of fine-grained, argillaceous, marine sediments with a varying content of calcareous material. Calcareous claystones, siltstones and marlstones dominate, but subordinate layers of limestone and sandstone occur. The claystones are generally light to dark grey, olive-grey, greenish and brownish, often becoming light grey, light greenish-grey and light olive-grey marlstones. Mica, pyrite and glauconite are common. Generally, marlstones become the more dominant lithology in both the upper and lower parts of the group. On Haltenbanken, the group consists of calcareous and non-calcareous claystones inter-bedded with marls and stringers of carbonates and sandstones. Sandstones are more common in the upper part of the group.

### Basal stratotype

The lower boundary is usually well defined and is recognised by a distinct decrease in gamma-ray response and an increase in velocity when passing upward from the generally more organic-rich shales of the underlying Upper Jurassic formations ([Fig 5.12](#), [5.13](#), [5.14](#) and [5.22](#)).

### Characteristics of the upper boundary

South of approximately 59° N ([Fig 5.32ab](#)), the upper boundary is the base of the chalk facies of the [Shetland Group](#), defined by the onset of a decrease in gamma-ray response and an increase in velocity into the overlying carbonates ([Fig 5.12](#), [5.13](#), [5.14](#), [5.15](#) and [5.22](#), [5.23](#), [5.24](#), [5.25](#), [5.26](#), [5.27](#), [5.28](#)). The uppermost [Rødby Formation](#) of the Cromer Knoll Group often appears on logs as a transition between the overlying carbonates of the [Shetland Group](#) and the more argillaceous parts of the Cromer Knoll Group ([Fig 5.12](#), [5.22](#)). Further north, the upper boundary is the base of the siliclastic facies of the [Shetland Group](#) ([Fig 5.32ab](#)). This boundary is normally also shown by a decrease in gamma-ray response and an increase in velocity when passing into the overlying, generally more calcareous, [Svarte Formation](#) of the [Shetland Group](#) ([Fig 5.33](#), [5.36](#)). However, the opposite log response at the boundary is also observed ([Fig 5.37](#)).

### Distribution

The group is widely distributed in the Norwegian sector of the North Sea. It is absent from the highest parts of the Mandal High, Jæren High, Utsira High and Lomre Terrace in the Troll area and locally from the Tampen Spur ([Fig 5.7](#), [5.8](#), [5.9](#), [5.10](#), [5.11](#)). The group's representatives are found throughout the Halten Terrace and in basinal areas to the west. There is little lateral variation apart from a gradual increase in sandstone content to the north. The sequence is generally several hundred metres thick on the Halten Terrace and within the Helgoland Basin, but it is much thinner and locally absent on the Trøndelag Platform. The group is not preserved on parts of the Nordland Ridge nor on local highs along the western flank of the Trøndelag Platform.

### Age

Ryazanian (usually late) to Albian/Early Cenomanian (North Sea). Ryazanian to Turonian (Norwegian Sea).

### Depositional environment

Open marine, with generally low energy (North Sea). The sediments were deposited in shallow to deep marine environments (Norwegian Sea).

### Subdivision

Six formations are defined within the group in the Norwegian sector of the North Sea ([Fig 5.7](#), [5.8](#), [5.9](#), [5.10](#), [5.11](#)): the [Åsgard](#), [Tuxen](#) (Jensen et al. 1986), [Mime](#), [Sola](#) (Hamar & Hesjedal 1983; Jensen et al. 1986), [Rødby](#) and [Agat](#) formations. In addition we recognise a need to introduce the Ran sandstone units ([Fig 5.7](#), [5.8](#), [5.9](#), [5.10](#), [5.11](#)). [Fig 5.4](#) shows an idealised development of the Cromer Knoll Group in the northern and central North Sea. In the Norwegian Sea the Cromer Knoll Group comprises three formations in the area ([Fig 4.25](#), [4.26](#)): [Lyr](#), [Lange](#) and [Lysing](#) formations.

**Remarks**

The group was erected by Rhys (1974) to embrace three marine, arenaceous, argillaceous to marly formations of mainly Early Cretaceous age recognisable onshore and offshore. Deegan & Scull (1977) formally defined the group to include the sediments between the underlying Humber Group and Bream Formation and the overlying [Shetland](#) and Chalk groups. Vollset & Doré (1984) replaced the Humber Group of the northern North Sea by the [Viking Group](#), and the Bream Formation in the Central Trough and the Norwegian-Danish Basin by the [Tyne](#) and [Boknfjorden](#) groups, respectively. The tops of the [Draupne Formation](#) of the [Viking Group](#), the [Mandal Formation](#) of the [Tyne Group](#) and the [Flekkefjord Formation](#) of the [Boknfjorden Group](#) define the base of the Cromer Knoll Group. The Cromer Knoll Group is partly equivalent to the Rijnland Group of the Dutch sector (NAM & RGD 1980, Crittenden 1982) and the Speeton Clay Formation together with the Red Chalk Formation of the UK sector (Rhys 1974). The subdivision in this paper can be used for the Danish sector (see also Jensen et al. 1986).
