

Generell informasjon

Litostrat. enhet	LYR FM
NPDID for litostrat. enhet	98
Nivå	FORMATION
Litostrat. enhet, forelder	CROMER KNOLL GP

Nivå under

Litostrat. enhet

Beskrivelse

Lyr Formation

Name

From the fish species *Pollachius pollachius* (pollack).

Well type section

Well [6506/12-1](#) (Statoil), coordinates 65°10'07.58"N, 06°43'44.07"E, from 3836 m to 3812.5 m ([Fig 4.27](#)). No cores.

Well reference section

Well [6407/1-2](#) (Statoil), coordinates 64°47'50.61"N, 07°02'23.76"E, from 3526 m to 3510 m ([Fig 4.28](#)). No cores.

Thickness

23.5 m in the type well and 16 m in the reference well.

Lithology

The formation consists of light/medium grey to light greyish-green marls with interbedded carbonates.

Basal Stratotype

In the type well the base is defined by a decrease of interval transit times shown by the sonic log. The gamma ray and the resistivity responses also decrease.

The base has been sampled in shallow cores from the eastern part of the Trøndelag Platform (Bugge et al. 1984), but logs and detailed descriptions are not yet available.

Lateral extent and variation

The formation is encountered in all wells on Halten Terrace, but is absent on the Nordland Ridge and on structural highs on the Nordland Ridge and the Trøndelag Platform. The carbonate content is expected to decrease to the west in the Møre and Vøring Basins. The formation consists of very thin limestones with intraformational conglomerates on the eastern part of the Trøndelag Platform (Bugge et al. 1984).

Age

Valanginian to Early Aptian.

Depositional environment

The formation was deposited under open marine conditions.

Correlation

The Lyr Formation is comparable to the Valhall Formation¹¹⁾ (Deegan and Scull, 1977) in the central North Sea. It is also equivalent to the Leira Member on Andøya (Dalland, 1979).
