

Generell informasjon

Brønnbane navn	2/6-1
Type	EXPLORATION
Formål	WILDCAT
Status	P&A
Faktakart i nytt vindu	lenke til kart
Hovedområde	NORTH SEA
Brønn navn	2/6-1
Seismisk lokalisering	LINE 686201 SP. 30.
Utvinningstillatelse	008
Boreoperatør	Elf Petroleum Norge AS
Boretillatelse	21-L
Boreinnretning	OCEAN VIKING
Boredager	40
Borestart	21.04.1969
Boreslutt	30.05.1969
Frigitt dato	30.05.1971
Publiseringssdato	09.03.2009
Opprinnelig formål	WILDCAT
Gjenåpnet	NO
Innhold	DRY
Funnbrønnbane	NO
Avstand, boredekk - midlere havflate [m]	29.0
Vanndybde ved midlere havflate [m]	69.0
Totalt målt dybde (MD) [m RKB]	3336.0
Maks inklinasjon [°]	2.5
Temperatur ved bunn av brønnbanen [°C]	95
Eldste penetrerte alder	LATE PERMIAN
Eldste penetrerte formasjon	ZECHSTEIN GP
Geodetisk datum	ED50
NS grader	56° 35' 52" N
ØV grader	3° 54' 55" E
NS UTM [m]	6273128.34
ØV UTM [m]	556201.47
UTM sone	31
NPID for brønnbanen	160

Brønnhistorie

General

Well 2/6-1 is located on the north eastern slope of the Mandal High between the Søgne Basin and the Central Graben in the North Sea. It was drilled on a salt induced anticlinal structure. The objective of the well was to investigate the sedimentary section down to the Permian salt, and particularly to test the hydrocarbon potential of the Tertiary and Mesozoic sands.

Operations and results

Wildcat well 2/6-1 was spudded with the semi-submersible installation Ocean Viking on 21 April 1969 and drilled to TD at 3336 m in salt belonging to the Late Permian Zechstein Group. Down to 615 m the well was drilled with sea water as drilling fluid, and the returns were to the sea floor. From 615 m to TD a sea water/LFC type mud was used. The only significant drilling problem occurred at a depth of 3220 m in the top of the Mesozoic sands when the well kicked 6.35 m³ of water associated with a gas show. The flow rate was 20 m³/hr and the pressure was estimated to 480 kg/cm². The kick was killed with a 1.65 g/cm³ mud.

Forty meter of Middle and Late Jurassic sands revealed good reservoir properties, but contained no hydrocarbons. Average reservoir properties in these sands were 20% porosity and 140 mD permeability. The Tertiary sediments contained very little sand. Shows were described as follows: in the Paleocene siltstones and shales, a small chloroform cut was obtained on sidewall samples and in the Mesozoic sands, traces of bitumen occur and a chloroform cut was obtained. One conventional core of Jurassic sandstone was cut at 3223 to 3235 m. No wire line fluid samples were taken.

The well was permanently abandoned on 30 May 1969 as a dry well.

Testing

No drill stem test was performed.
