

## Generell informasjon

Brønnbane navn	25/11-4
Type	EXPLORATION
Formål	APPRAISAL
Status	P&A
Faktakart i nytt vindu	<a href="#">lenke til kart</a>
Hovedområde	NORTH SEA
Felt	<a href="#">BALDER</a>
Funn	<a href="#">25/11-1 Balder</a>
Brønn navn	25/11-4
Seismisk lokalisering	line SC -68 sp 6942
Utvinningstillatelse	<a href="#">001</a>
Boreoperatør	Esso Exploration and Production Norway A/S
Boretillatelse	49-L
Boreinnretning	<a href="#">GLOMAR GRAND ISLE</a>
Boredager	37
Borestart	15.10.1970
Boreslutt	20.11.1970
Frigitt dato	20.11.1972
Publiseringsdato	30.04.2010
Opprinnelig formål	APPRAISAL
Gjenåpnet	NO
Innhold	SHOWS
Funnbrønnbane	NO
Avstand, boredekk - midlere havflate [m]	10.0
Vanndybde ved midlere havflate [m]	127.0
Totalt målt dybde (MD) [m RKB]	1896.0
Temperatur ved bunn av brønnbanen [°C]	71
Eldste penetrerte alder	PALEOCENE
Eldste penetrerte formasjon	EKOISK FM
Geodetisk datum	ED50
NS grader	59° 9' 37.3" N
ØV grader	2° 23' 26.53" E
NS UTM [m]	6558219.15
ØV UTM [m]	465155.95
UTM sone	31
NPID for brønnbanen	186

## Brønnhistorie

### General

Well 25/11-4 was drilled ca 2.6 km south-south west of the 25/11-1 Balder discovery well on the Utsira High in the North Sea. The objective was to define the continuity of oil bearing sands of Early Eocene age that were present in 25/11-1 well.

### Operations and results

Appraisal well 25/11-4 was spudded with the vessel Glomar Grand Isle on 15 October 1970 and drilled to TD at 1896 m in the Early Paleocene Ekofisk Formation. Drilling operations were normal down to 963 m and at that depth problems with the Hydril necessitated pulling the riser and upper part of the B.O.P. stack. While drilling at 1753 m weather conditions hampered drilling and it was necessary to again pull the riser and upper part of the stack. After losing several days due to weather conditions the well was completed, however, during the midst of the logging operations, storm warnings made it necessary to shorten the program and the planned velocity survey was not made. Initial drilling from the seafloor to 179 m was with sea water and gel. Below 179 to a depth of 948 m, the mud system consisted of seawater, Spersene XP-20 Salinex. From 948 m to TD fresh water Spersene XP-20 mud was used.

The well penetrated the Utsira Formation and several Skade Formation sand units and then entered a ca 500 m thick section of shales belonging to the lower Hordaland Group before top Balder formation was encountered at 1695 m. The Balder Formation (Early Eocene) proved almost void of reservoirs. It was all silty shale except a 4 foot sand section between 1740 and 1742 m. This sand had a good oil stain, bright yellow fluorescence and a bright yellow cut. The only massive reservoir present was the Paleocene Hermod Formation sand from 1792 to 1816 m. This sand had no hydrocarbon shows.

No conventional cores were cut in the well and no wire line fluid sampling was attempted.

The well was permanently abandoned on 20 November 1970 as a dry well with shows.

### Testing

No drill stem test was performed.
