

Generell informasjon

Brønnbane navn	33/9-18 A
Type	EXPLORATION
Formål	WILDCAT
Status	P&A
Faktakart i nytt vindu	lenke til kart
Hovedområde	NORTH SEA
Brønn navn	33/9-18
Seismisk lokalisering	CTM 94-3D: INLINE 1127 & CROSSLINE 492
Utvinningstillatelse	037
Boreoperatør	Den norske stats oljeselskap a.s
Boretillatelse	800-L
Boreinnretning	DEEPSEA BERGEN
Boredager	35
Borestart	21.12.1994
Boreslutt	24.01.1995
Frigitt dato	24.01.1997
Publiseringsdato	01.07.2004
Opprinnelig formål	WILDCAT
Gjenåpnet	NO
Innhold	DRY
Funnbrønnbane	NO
Avstand, boredekk - midlere havflate [m]	23.0
Vanndybde ved midlere havflate [m]	145.0
Totalt målt dybde (MD) [m RKB]	3595.0
Totalt vertikalt dybde (TVD) [m RKB]	3195.0
Temperatur ved bunn av brønnbanen [°C]	100
Eldste penetrerte alder	LATE JURASSIC
Eldste penetrerte formasjon	DRAUPNE FM
Geodetisk datum	ED50
NS grader	61° 15' 40.78" N
ØV grader	1° 56' 7.73" E
NS UTM [m]	6792522.53
ØV UTM [m]	442897.08
UTM sone	31
NPID for brønnbanen	2455

Brønnhistorie

General

Well 33/9-18 A was drilled to a structure situated east of the Statfjord Field and southwest of the Tordis Field. The main objective of well 33/9-18 A was to test the lithology of a strong seismic amplitude within the same prospect as drilled in well 33/9-18. Well 33/9-18 A is a sidetrack from well 33/9-18.

Operations and results

Exploration well 33/9-18 A was spudded on 21 December 1994 with the semi-submersible installation Deepsea Bergen and drilled from kick-off at 1974 m to TD at 3597 m in the Late Jurassic Draupne Formation. The 12 1/4" hole section was drilled with KC1/PAC POLYMER and KCl mud system to prevent bit balling. No shallow gas was recorded.

Parts of the 12 1/4" section have anomalous resistivity data. The MWD data records from 3070 m to TD are missing, due to washout, lost signal, stuck pipe and MWD tool lost in hole. No wireline logging was performed. 1 core was cut in the Draupne Formation the interval 3397-3404.5 m. No fluid samples were collected. Bit balling was observed several times and a lot of pills were pumped to prevent balling, but minor effects were observed. Dyno-CC-115 (soap) pills showed best results. Drilling from 3145 m to 3397 m had to stop after 49 m due to bad weather. Drilling continued after 7 days stop and the flow rate was increased to maintain a pressure of 280 bar. At TD the actual pressure was nearly 100 bar less than the "theoretical" pressure. This pressure drop was caused by wash out between two drill collars. Got differential stuck at 3512 m when pulling out of the hole. Cut the string at 3382 m to get free. Extra cost related to logistics is estimated to approximately 3.3 mill. NOK. The well was plugged and abandoned after being stuck for 83.5 hrs.

The well has been interpreted to penetrate large slump/slide blocks consisting of the Brent Group, the Dunlin Group and the Statfjord Formation which are deposited within the Draupne Formation. The strong seismic amplitude within the sidetrack 33/9-18 A was penetrated. The amplitude was represented by occasional water wet sandstone and hard shales. No hydrocarbon shows were observed in the well.

The well 33/9-18 A was permanently plugged and abandoned as a dry well on 24 January 1995.

Testing

No drill stem test was performed
