

General information

Wellbore name	36/7-2
Type	EXPLORATION
Purpose	WILDCAT
Status	P&A
Factmaps in new window	link to map
Main area	NORTH SEA
Discovery	36/7-2 (Ulven)
Well name	36/7-2
Seismic location	NH 9205 - 113 A & SP. 625
Production licence	153
Drilling operator	Norsk Hydro Produksjon AS
Drill permit	869-L
Drilling facility	WEST VANGUARD
Drilling days	21
Entered date	02.09.1997
Completed date	22.09.1997
Release date	22.09.1999
Publication date	23.05.2006
Purpose - planned	WILDCAT
Reentry	NO
Content	OIL
Discovery wellbore	YES
1st level with HC, age	LATE JURASSIC
1st level with HC, formation	FENSFJORD FM
Kelly bushing elevation [m]	22.0
Water depth [m]	269.0
Total depth (MD) [m RKB]	1435.0
Final vertical depth (TVD) [m RKB]	1435.0
Maximum inclination [°]	1.8
Bottom hole temperature [°C]	34
Oldest penetrated age	PRE-DEVONIAN
Oldest penetrated formation	BASEMENT
Geodetic datum	ED50
NS degrees	61° 18' 23.5" N
EW degrees	4° 19' 47" E
NS UTM [m]	6797817.45
EW UTM [m]	571225.20
UTM zone	31
NPDID wellbore	2990

Wellbore history

<p>General</p> <p>Well 36/7-2 was drilled on the Øygarden Fault Complex, ca 14 km west of the outer skerries of Bulandet in Sogn og Fjordane county. The primary target were the Late Jurassic Sognefjord and the Upper Jurassic Fensfjord formations.</p> <p>Operations and results</p> <p>Wildcat well 36/7-2 was spudded with the semi-submersible installation West Vanguard on 2 September 1997 and drilled to TD at 1435 m in basement rock. An anchor test was performed after setting the 13 3/8" casing shoe. Anchor no. 2 and 3 failed the test to 180 ton and slipped at 170 ton. Piggyback anchors were set on anchor no. 2, while main anchor no. 3 was lost. Fishing for the anchor chain was delayed 47.5 hrs due to bad weather. The anchor chain was retrieved and the anchor reset with two piggy backs. Both anchors then stood a successful test. The well was drilled with seawater and hi-vis pills down to 591 m and with ANCO 2000 from 591 m to TD.</p> <p>The well discovered heavily biodegraded oil in the Middle Jurassic deltaic sandstone reservoir of the Fensfjord Formation. The overlying Sognefjord Formation sands were tight and contained no hydrocarbons. A 32.5 m oil column was proven from 931.5 to ca 964.0 m. The exact level of the oil-water contact could not be determined as it was in a shaley zone. Oil shows on cuttings were recorded from 915 m down to 1045 m. The reservoir zone of the Fensfjord Formation was divided into two units, from which only the upper had good reservoir properties.</p> <p>No conventional cores were cut, but 60 sidewall cores were taken from 603 to 1408 m with a recovery of 56 samples. The MDT tool was run and 23 good pressure points were acquired in addition to a fluid sample at 934.5 m.</p> <p>The well was completed on 22 September 1997 as an oil discovery.</p> <p>Testing</p> <p>No drill stem test was performed.</p>

Pressure plots

The pore pressure data is sourced from well logs if no other source is specified. In some wells where pore pressure logs do not exist, information from Drill stem tests and kicks have been used. The data has been reported to the NPD, and further processed and quality controlled by IHS Markit.
