

## General information

Wellbore name	15/9-19 A
Type	EXPLORATION
Purpose	APPRAISAL
Status	P&A
Factmaps in new window	<a href="#">link to map</a>
Main area	NORTH SEA
Field	<a href="#">VOLVE</a>
Discovery	<a href="#">15/9-19 S Volve</a>
Well name	15/9-19
Seismic location	3D ST9407r96 & INLINE 1646& X-LINE 1711
Production licence	<a href="#">046</a>
Drilling operator	Den norske stats oljeselskap a.s
Drill permit	898-L
Drilling facility	<a href="#">BYFORD DOLPHIN</a>
Drilling days	108
Entered date	25.07.1997
Completed date	09.11.1997
Release date	09.11.1999
Publication date	15.12.2006
Purpose - planned	APPRAISAL
Reentry	NO
Content	OIL
Discovery wellbore	NO
1st level with HC, age	MIDDLE JURASSIC
1st level with HC, formation	HUGIN FM
Kelly bushing elevation [m]	25.0
Water depth [m]	85.0
Total depth (MD) [m RKB]	4131.0
Final vertical depth (TVD) [m RKB]	3319.0
Maximum inclination [°]	59
Bottom hole temperature [°C]	117
Oldest penetrated age	TRIASSIC
Oldest penetrated formation	SMITH BANK FM
Geodetic datum	ED50
NS degrees	58° 26' 9.25" N
EW degrees	1° 55' 47.05" E
NS UTM [m]	6477887.72

EW UTM [m]	437506.71
UTM zone	31
NPDID wellbore	3145

**Wellbore history**

### General

The well 15/9-19 SR on the Theta Vest structure North of the Sleipner East Field proved oil in the Hugin Formation in 1993. The objective for the well 15/9-19 A, a side-track from this well, was to confirm a minimum economic hydrocarbon volume in the Hugin Formation and map the extension of the oil-bearing formation.

### General

The well 15/9-19 SR on the Theta Vest structure North of the Sleipner East Field proved oil in the Hugin Formation in 1993. The objective for the well 15/9-19 A, a side-track from this well, was to confirm a minimum economic hydrocarbon volume in the Hugin Formation and map the extension of the oil-bearing formation.

### Operations and results

Well 15/9-19 A was kicked off from 2178 m in well bore 15/9-19 SR on 25 July 1997, using the semi-submersible installation Byford Dolphin. The well was drilled through the Skagerrak Formation and terminated approximately 30 m TVD into the Triassic Smith Bank Formation at 4131 m (3318.5 m TVD RKB). The final acquisition programme immediately after reaching the total depth of the well was strongly affected by a labour conflict, which delayed the well operations for 32.5 days. The originally planned open hole electric logging program had to be terminated and the 7" casing run to TD in order to secure the well. The later cased hole logging failed due to tool problems. The well was drilled oil based with the Ultidril mud system (oil base consists of synthetic olefins) from kick-off to TD.

Top of the Hugin Formation was penetrated at 3796.5 m (3015.5 m TVD RKB) approximately 60 m TVD deeper than prognosed. It was 153 m thick (TVD) and oil-bearing. The total oil column in the well was 80 m, but no clear oil-water contact was observed. The base of the reservoir was at 3919 m (-3126.5 m TVD RKB). Seven cores were cut in the interval 3838 m to 4017 m in the Hugin and Skagerrak Formations, with a total recovery of 177.6 m. One attempt was made to run FMT on PCL for pressure points and fluid sampling. The run failed for technical reasons and no further attempts were made due to the labour conflict.

The well was permanently abandoned on 9 November 1997 as an oil appraisal.

### Testing

Three tests were performed in order to evaluate the well, one in the water zone and two in the oil zone.

Test 1 at 3952 - 3958 m (3159.8 - 3165.5 m TVD RKB), was in the water zone to obtain water samples due to MDT failure during wire line logging. Four good samples were obtained, indicating similar formation water as in other wells in the Sleipner area. Maximum recorded temperature in this test was 112.7 deg C.

Test 2A at 3885.5 - 3888.5 m (3100 - 3102.5 m TVD RKB) flowed 300 Sm<sup>3</sup> oil and 27000 Sm<sup>3</sup> gas /day through a 38/64" choke during the cleanup flow. The corresponding GOR was 90 Sm<sup>3</sup>/Sm<sup>3</sup>, the oil density was 0.892 g/cm<sup>3</sup>, and the gas gravity was 0.738 (air = 1) with 2.5 ppm H<sub>2</sub>S and 3% CO<sub>2</sub>. The temperature recorded in this flow period was 112.3 deg C.

Test 2B at 3885.5 - 3888.5 m + 3826 -3865 m (3100 - 3102.5 m + 3046.2 - 3081.3 m TVD RKB) flowed 528 Sm<sup>3</sup> oil and 38107 Sm<sup>3</sup> gas /day through a 34/64" choke during the main flow. The corresponding GOR was 72 Sm<sup>3</sup>/Sm<sup>3</sup>, the average oil density was 0.902 g/cm<sup>3</sup>, and the average gas gravity was 0.730 (air = 1) with 2.8 ppm H<sub>2</sub>S and 3.5% CO<sub>2</sub>. The temperature recorded in this flow period was 110.8 deg C.
