

### General information

Wellbore name	24/12-1
Type	EXPLORATION
Purpose	WILDCAT
Status	SUSPENDED
Factmaps in new window	<a href="#">link to map</a>
Main area	NORTH SEA
Well name	24/12-1
Seismic location	Sd 260 line 403-329
Production licence	<a href="#">045</a>
Drilling operator	Den norske stats oljeselskap a.s
Drill permit	189-L
Drilling facility	<a href="#">ROSS RIG (1)</a>
Drilling days	84
Entered date	16.01.1978
Completed date	09.04.1978
Release date	09.04.1980
Publication date	01.12.2004
Purpose - planned	WILDCAT
Reentry	NO
Content	DRY
Discovery wellbore	NO
Kelly bushing elevation [m]	25.0
Water depth [m]	113.0
Total depth (MD) [m RKB]	3966.0
Final vertical depth (TVD) [m RKB]	3966.0
Maximum inclination [°]	1.2
Bottom hole temperature [°C]	141
Oldest penetrated age	EARLY CRETACEOUS
Oldest penetrated formation	SOLA FM
Geodetic datum	ED50
NS degrees	59° 2' 29.8" N
EW degrees	1° 52' 57.93" E
NS UTM [m]	6545372.48
EW UTM [m]	435888.07
UTM zone	31
NPID wellbore	347

## Wellbore history

### General

Well 24/12-1 is located on the Gudrun Terrace ca 15 km east of the border to British sector. The purpose of the well was to evaluate a seismic closure, named Gamma, in the southern part of the Block. The main target was the Middle Jurassic sands. Well 24/12-1 was the first of two phases in drilling the borehole, and this first phase was planned to reach the Early Cretaceous only. The main target was planned to be reached in a later re-entry with a different rig than was available at the time when the well was scheduled.

The well is Type Well for the Skade Formation and Reference Well for the Grid Formation.

### Operations and results

Wildcat well 24/12-1 was spudded with the semi-submersible installation Ross Rig on 16 January 1978. At the time when the well was to be spudded, Statoil did not have available a rig equipped with a 15000 psi BOP stack and associated equipment. The well was therefore spudded with Ross Rig, which was equipped with a 10000 psi BOP. Ross Rig drilled the well down to 3966 m in the Early Cretaceous Sola Formation. The 9 5/8" casing was set and the well was temporarily plugged and abandoned. The problems experienced during PHASE I were primarily related to weather (anchor chain breakage and WOW), BOP-stack, and items lost into the hole and the sea. The well was drilled with seawater and gel from down to 771 m, with lignosulphonate mud from 771 m to 2874 m, and with lignosulphonate/lignite/CMC from 7874 m to TD. From 2870 m 1 % to 8% oil was added to the mud.

Tertiary sandstone intervals were encountered in the Utsira Formation (497 m to 730 m), the Skade Formation (825 m to 1007 m), the Grid Formation (1502 m to 1660 m), and in the Paleocene Heimdal Formation (2326 m to 2700 m). No shows were encountered during drilling, but post-well organic geochemical analyses showed one cuttings sample from 2860 m to 2890 m to contain significant amounts of light hydrocarbons combined with a comparatively wet and mature cuttings gas. This could indicate migrated hydrocarbons, but the addition of oil to the mud at this depth makes the data inconclusive. Picked marl/clay lithology in the section from 3490 m to 3900 m (Coniacian to Albian) had TOC in the range 0.5% to 2.0 %, indicating fair source rock intervals in this section. No conventional cores were cut and no fluid samples taken.

The well was permanently abandoned as dry on 9 April 1978.

### Testing

No drill stem test was performed

## Cuttings at the Norwegian Offshore Directorate

Cutting sample, top depth [m]	Cutting samples, bottom depth [m]
