

General information

Wellbore name	35/10-3
Type	EXPLORATION
Purpose	WILDCAT
Status	P&A
Press release	link to press release
Factmaps in new window	link to map
Main area	NORTH SEA
Well name	35/10-3
Seismic location	ST 9303- INLINE 536 & CROSSLINE 2436
Production licence	173
Drilling operator	Den norske stats oljeselskap a.s
Drill permit	950-L
Drilling facility	TRANSOCEAN ARCTIC
Drilling days	22
Entered date	23.06.1999
Completed date	14.07.1999
Release date	14.07.2001
Publication date	18.12.2002
Purpose - planned	WILDCAT
Reentry	NO
Content	DRY
Discovery wellbore	NO
Kelly bushing elevation [m]	24.0
Water depth [m]	363.0
Total depth (MD) [m RKB]	2250.0
Final vertical depth (TVD) [m RKB]	2247.0
Maximum inclination [°]	4.4
Bottom hole temperature [°C]	65
Oldest penetrated age	LATE CRETACEOUS
Oldest penetrated formation	JORSALFARE FM
Geodetic datum	ED50
NS degrees	61° 2' 47.96" N
EW degrees	3° 7' 40.22" E
NS UTM [m]	6768151.37
EW UTM [m]	506904.47
UTM zone	31
NPIDID wellbore	3719

Wellbore history

General

Production License 173, block 35/10, is located north-northwest of the Troll, approximately 80 km off-shore Western Norway. Well 35/10-3 is the third well drilled within the PL 173 licence area. The objective of the well was to test the hydrocarbon potential of Paleocene deep marine sandstones (Hermod Formation) of the Sele Formation in the southern part of block 35/10, known as the the Graben Fill prospect. The reservoir was expected to consist of two deep marine fans, stacked on each other.

Operations and results

Wildcat well 35/10-3 was spudded 23 June 1999 with the semi-submersible installation "Transocean Arctic". First attempt to spud failed due to boulders at 427 m. The installation was moved 20 m and after a successful second spud it was drilled to a total depth of 2250 m in the Late Cretaceous Jorsalfare Formation. The well was drilled with bentonite/PAC down to 655 m and KCl polymer mud (Ultidrill) from 655 m to TD. No shallow gas was encountered. A class 2 warning (over-pressured shallow gas) was given for a sand layer prognosed at 675 m. The Hermod Formation was penetrated at 1948 m and consisted of 35 m sandstone, as prognosed. The sandstone was water filled. Weak direct fluorescence and a few grams with cut fluorescence and increase in heavy components in the background gas was described. The prognosed lower fan proved to consist of claystone. No conventional cores were cut and no fluid samples were taken.

The well was permanently plugged and abandoned as a dry well on 14 July 1999.

Testing

No drill stem test was performed

Pressure plots

The pore pressure data is sourced from well logs if no other source is specified. In some wells where pore pressure logs do not exist, information from Drill stem tests and kicks have been used. The data has been reported to the NPD, and further processed and quality controlled by IHS Markit.
