

## Generell informasjon

Brønnbane navn	25/10-1 R
Type	EXPLORATION
Formål	APPRAISAL
Status	P&A
Faktakart i nytt vindu	<a href="#">lenke til kart</a>
Hovedområde	NORTH SEA
Felt	<a href="#">BALDER</a>
Funn	<a href="#">25/11-1 Balder</a>
Brønn navn	25/10-1
Seismisk lokalisering	LINE SC 70-shotpoint 136
Utvinningstillatelse	<a href="#">028</a>
Boreoperatør	Esso Exploration and Production Norway A/S
Boretillatelse	32-L2
Boreinnretning	<a href="#">GLOMAR GRAND ISLE</a>
Boredager	27
Borestart	09.07.1970
Boreslutt	03.08.1970
Plugget og forlatt dato	03.08.1970
Frigitt dato	03.08.1972
Publiseringsdato	26.05.2009
Opprinnelig formål	WILDCAT
Gjenåpnet	YES
Årsak til gjenåpning	DRILLING/PLUGGING
Innhold	SHOWS
Funnbrønnbane	NO
Avstand, boredekk - midlere havflate [m]	10.0
Vanndybde ved midlere havflate [m]	124.0
Totalt målt dybde (MD) [m RKB]	2091.0
Totalt vertikalt dybde (TVD) [m RKB]	2091.0
Maks inklinasjon [°]	6
Temperatur ved bunn av brønnbanen [°C]	76
Eldste penetrerte alder	EARLY JURASSIC
Eldste penetrerte formasjon	STATFJORD GP
Geodetisk datum	ED50
NS grader	59° 11' 21.72" N

ØV grader	2° 19' 11.83" E
NS UTM [m]	6561488.14
ØV UTM [m]	461142.95
UTM sone	31
NPDID for brønnbanen	512

## Brønnhistorie

>

### General

Well 25/10-1 R is a re-entry of well 25/10-1, which found strong shows in thin Early Eocene sands, but was suspended at top Paleocene level due to heavy autumn storms. The purpose of the re-entry was to test the Early Eocene sands and to extend the well into deeper Paleocene sands, which were anticipated to be oil-bearing.

### Operations and results

Appraisal well 25/10-1 was re-entered (25/10-1 R) with the vessel Glomar Grand Isle on 9 July 1970. The re-entry well was kicked off at 1664 m in 25/10-1 and drilled to final TD at 2091 m in the Early Jurassic Statfjord Formation. No significant problems were encountered in the operations. The well was drilled with seawater/spersene XP-20, Slinex mud from kick-off to TD.

From kick-off down to 1747 m the well drilled the same lithology as the primary well. The underlying Paleocene section was composed of sands and shales, with the sand bed thicknesses ranging from about 4 to 40 m. These Paleocene sands were highly porous and permeable, but only the top 5 m had good oil shows and this section produced water only on wire line formation test. The Paleocene section rested directly on the Early Jurassic Statfjord Formation. Sands within the Statfjord Formation were of reservoir quality, but were water-wet with only streaks of non-fluorescing dead oil.

The section from 1731 to 1804.1 m was cored all through in five cores, with near 100% total recovery. The upper two of these (core #9 and #10) were partially overlapping with the lower three cores (core #6, #7, and #8) in well 25/10-1. A total of twelve wire line FIT samples were attempted and five of them were reported to contain formation fluid. FIT no 1 and 2 were taken in the Paleocene sands (Heimdal Formation) at 1789.2 m and 1778.2 m. These recovered only water and mud. The remaining successful FIT recovered hydrocarbons: FIT no 4 at 1760.8 m (Heimdal Formation) recovered gas and 4800 cm<sup>3</sup> oil, FIT no 6 at 1762.4 m (Heimdal Formation) recovered gas and 8250 cm<sup>3</sup> oil, while FIT no 7 at 1701.4 m (Balder Formation) recovered about 1000 cm<sup>3</sup> oil and oil-cut mud.

The well was permanently abandoned on 3 August 1970. It is classified as a well with shows.

### Testing

No drill stem test was performed.
