

Generell informasjon

Brønnbane navn	6407/7-7 S
Type	EXPLORATION
Formål	WILDCAT
Status	P&A
Pressemelding	lenke til pressemelding
Faktakart i nytt vindu	lenke til kart
Hovedområde	NORWEGIAN SEA
Felt	NJORD
Funn	6407/7-7 S
Brønn navn	6407/7-7
Seismisk lokalisering	NH9701:inline 1556 & crossline 564
Utvinningstillatelse	107
Boreoperatør	Norsk Hydro Petroleum AS
Boretillatelse	1138-L
Boreinnretning	TRANSOCEAN WINNER
Boredager	49
Borestart	03.08.2007
Boreslutt	20.09.2007
Frigitt dato	20.09.2009
Publiseringsdato	21.09.2009
Opprinnelig formål	WILDCAT
Gjenåpnet	NO
Innhold	GAS/CONDENSATE
Funnbrønnbane	YES
1. nivå med hydrokarboner, alder	MIDDLE JURASSIC
1. nivå med hydrokarboner, formasjon.	ILE FM
2. nivå med hydrokarboner, alder	EARLY JURASSIC
2. nivå med hydrokarboner, formasjon	TILJE FM
Avstand, boredekk - midlere havflate [m]	26.0
Vanndybde ved midlere havflate [m]	334.0
Totalt målt dybde (MD) [m RKB]	3886.0
Totalt vertikalt dybde (TVD) [m RKB]	3678.0
Maks inklinasjon [°]	54.7
Temperatur ved bunn av brønnbanen [°C]	141

Eldste penetrerte alder	EARLY JURASSIC
Eldste penetrerte formasjon	ÅRE FM
Geodetisk datum	ED50
NS grader	64° 17' 40.1" N
ØV grader	7° 7' 10.5" E
NS UTM [m]	7131351.02
ØV UTM [m]	408999.47
UTM sone	32
NPDID for brønnbanen	5550

Brønnhistorie

General

Well 6407/7-7 S was drilled on the North West Flank of the Njord Field in the Norwegian Sea. The Njord North West Flank consists of two main fault blocks, A and B-main. Well 6407/7-6 was drilled on the B-main structure in 2000 and confirmed the presence of rich gas condensate in the Tilje Formation, with a GWC at 3749 m TVD MSL. Well 6407/7-7 S is the first exploration well to be drilled into the A structure. The primary objective of well 6407/7-7 S was to prove commercial hydrocarbon resources within the Early Jurassic Tilje Formation and the Middle Jurassic Ile Formation.

Operations and results

Well 6407/7-7 S was spudded on 3 August 2007 as a producer 6407/7-B1 Y1H and drilled down to TD of the 17 1/2" section at 2270 m where a 14" casing was set. The exploration well 6407/7-7 S started when drilling out of the 14" casing and into the A-segment of the Njord North West Flank. The hole was vertical down to ca 1290 m. Hole deviation was ca 11 deg at 2270, increasing to 54 deg at 2770 m and falling back again to 6 deg at TD. The well was drilled with the semi-submersible installation Transocean Winner to final TD at 3886 m (3678 m TVD) in Early Jurassic sediments of the Åre Formation. The well was drilled with seawater down to 2270 m and with VERSATEC oil based mud from 2270m to TD.

Top Ile Formation was encountered at 3376 m. Hydrocarbons were discovered in the Ile, Tilje and Åre Formations. MDT pressure points show that the Åre-Tilje reservoir is about 26 bar overpressured compared to the Ile compartment. There were also indications of hydrocarbons in the Lower Cretaceous Lange Formation intra-sands, but too low permeability made it impossible to record pressure points and get fluid samples.

Five cores were cut in the well. Core 1 was cut at 3378 - 3405 m in the Ile Formation. Cores 2 to 5 were cut from 3589 m to 3720.5 m in the Tilje Formation and ca 8 m into the top of the Åre Formation. Condensate and oil samples were taken on MDT wire line at several levels in the Early - Middle Jurassic. Typical fluid characteristics from single stage separation in the PVT laboratory were: condensate from 3397 m in the Ile Formation had GOR = 1250 Sm3/Sm3, oil density = 0.803 g/cm³, and gas gravity of 0.790 (air = 1); condensate from 3623.35 m in the Tilje Formation had GOR = 1340 Sm3/Sm3, oil density = 0.810 g/cm³, and gas gravity of 0.763 (air = 1); condensate from 3718.5 m in the Åre Formation had GOR = 770 Sm3/Sm3, oil density = 0.813 g/cm³, and gas gravity of 0.787 (air = 1); condensate from 3733 m in the Åre Formation had GOR = 540 Sm3/Sm3, oil density = 0.813 g/cm³, and gas gravity of 0.822 (air = 1); while the oil from 3829 m in the Åre Formation had GOR = 440 Sm3/Sm3, oil density = 0.821 g/cm³, and gas gravity of 0.885 (air = 1).

The well was plugged back to the 14" casing from where drilling of the producer 6407/7-B1 Y1H was resumed by performing a side track inside casing. The 6407/7-7 S well bore was permanently abandoned on 20 September 2007 as a condensate/gas discovery.

Testing

No drill stem test was performed.

Trykkplott

Porertrykksdataene kommer fra logging i brønnen hvis ingen annen kilde er oppgitt. I noen brønner der trykk ikke er logget, er det brukt informasjon fra formasjonstester eller brønnspark. Trykkdataene er rapportert inn til Oljedirektoratet og videre prosessert og kvalitetssikret av IHS Markit.
