

**Generell informasjon**

Brønnbane navn	35/7-1 S
Type	EXPLORATION
Formål	WILDCAT
Status	P&A
Pressemelding	<a href="#">lenke til pressemelding</a>
Faktakart i nytt vindu	<a href="#">lenke til kart</a>
Hovedområde	NORTH SEA
Brønn navn	35/7-1
Seismisk lokalisering	Survey:MC3DMF367-R08-inline3014 & crossline 6288
Utvinningstillatelse	<a href="#">377 S</a>
Boreoperatør	Idemitsu Petroleum Norge AS
Boretillatelse	1356-L
Boreinnretning	<a href="#">AKER BARENTS</a>
Boredager	95
Borestart	13.05.2011
Boreslutt	15.08.2011
Frigitt dato	15.08.2013
Publiseringsdato	15.08.2013
Opprinnelig formål	WILDCAT
Gjenåpnet	NO
Innhold	DRY
Funnbrønnbane	NO
Avstand, boredekk - midlere havflate [m]	40.0
Vanndybde ved midlere havflate [m]	386.0
Totalt målt dybde (MD) [m RKB]	4825.0
Totalt vertikalt dybde (TVD) [m RKB]	4813.0
Maks inklinasjon [°]	9.2
Temperatur ved bunn av brønnbanen [°C]	168
Eldste penetrerte alder	EARLY JURASSIC
Eldste penetrerte formasjon	AMUNDSEN FM
Geodetisk datum	ED50
NS grader	61° 21' 38.86" N
ØV grader	3° 13' 11.73" E
NS UTM [m]	6803157.24
ØV UTM [m]	511760.25
UTM sone	31
NPDID for brønnbanen	6599

## Brønnhistorie

### General

Well 35/7-1 S was drilled on the Apollon prospect on the Marflo Spur, west of the Vega Field in the Northern North Sea. The main objective for the well was to test the hydrocarbon potential in Tarbert, Ness and Etive formations sandstones of the Middle Jurassic Brent Group. The secondary objective was to prove hydrocarbons in the Lower Jurassic Cook Formation within the Dunlin Group. The well was designed with an S-shaped path to avoid a possible gas charged sand.

### Operations and results

Well 35/7-1 S was spudded with the semi-submersible installation Aker Barents on 13 May 2011. A 9-7/8" pilot hole was drilled below the 30" casing shoe to section TD at 1414 m to check for shallow gas. No shallow gas was recorded. Severe mud losses were experienced when drilling the 17-1/2" section in the transition from Balder to Sele formations at 1855 m. Decision was made to plug back the existing 17-1/2" section and sidetrack the well from below the 20" casing shoe, at 1425 m. When the 12 1/4" section was drilled to just above prognosed section TD, an influx of 400 l was reported and the well shut-in. The well kill with 10 SPM was performed and was successful. This was however an extremely slow rate to kill such a long well and required an extensive amount of time. After the well kill, the 9 7/8" casing was run and cemented and the 35/7-1 ST2 technical sidetrack was drilled on without significant problems to TD at 4825 in the Early Jurassic Amundsen Formation. The well was drilled with seawater and hi-vis pills down to 511 m, with Glydril/KCl mud from 511 m to 1414 m in the primary well and to 1417 m in the sidetrack, with Versatec oil based mud from 1417 m to 3736 m and with Versatherm OBM from 3736 m to TD.

All stratigraphic tops for the well were encountered within the given depth uncertainty. Top Brent Group was encountered at 4293 m, 18 m shallower than prognosed; and top Cook Formation at 4669 m, 12.5 m deeper than prognosed. No producible hydrocarbons were encountered in the target Brent Group and Dunlin Formation sandstones. No oil shows were reported from the well.

No cores were cut, and a dry hole wire line program was executed. No wire line fluid samples were taken.

The well was permanently abandoned on 15 August 2011 as a dry well.

### Testing

No drill stem test was performed.
