

## Generell informasjon

Brønnbane navn	2/8-18 S
Type	EXPLORATION
Formål	WILDCAT
Status	P&A
Pressemelding	<a href="#">lenke til pressemelding</a>
Faktakart i nytt vindu	<a href="#">lenke til kart</a>
Hovedområde	NORTH SEA
Brønn navn	2/8-18
Seismisk lokalisering	GA3D-93R05 inline 1512 & xline 555
Utvinningstillatelse	<a href="#">440 S</a>
Boreoperatør	Faroe Petroleum Norge AS
Boretillatelse	1386-L
Boreinnretning	<a href="#">MÆRSK GUARDIAN</a>
Boredager	51
Borestart	23.05.2012
Boreslutt	13.07.2012
Frigitt dato	13.07.2014
Publiseringdato	09.12.2014
Opprinnelig formål	WILDCAT
Gjenåpnet	NO
Innhold	DRY
Funnbrønnbane	NO
Avstand, boredekk - midlere havflate [m]	43.0
Vanndybde ved midlere havflate [m]	69.0
Totalt målt dybde (MD) [m RKB]	2852.0
Totalt vertikalt dybde (TVD) [m RKB]	2662.0
Maks inklinasjon [°]	36.7
Eldste penetrerte alder	LATE CRETACEOUS
Eldste penetrerte formasjon	HIDRA FM
Geodetisk datum	ED50
NS grader	56° 22' 37.58" N
ØV grader	3° 22' 25.09" E
NS UTM [m]	6248253.07
ØV UTM [m]	523076.52
UTM sone	31
NPID for brønnbanen	6747

## Brønnhistorie

### General

The 2/8-18 S well was drilled on the Clapton Prospect in the Feda Graben in the Norwegian North Sea. The main target was chalks of the Shetland Group, analogous to the nearby fields Eldfisk, Eldfisk East, Valhall and Ekofisk.

### Operations and results

Wildcat well 2/8-18 S was spudded with the jack-up installation Mærsk Guardian on 23 May 2012 and drilled to TD at 2852 m ((2662 m TVD) in the Late Cretaceous Hidra Formation. It was drilled deviated to avoid shallow gas over the crest of the structure and to penetrate the steeply dipping reservoir at the right angle. The well was vertical down to 1506 m and built up to a sailing angle of ca 36 deg at 1900 m. The well was drilled with KCL/GEM mud down to 568 m and with oil based XP-07 mud from 568 m to TD.

Oil shows were encountered in the Utsira Formation at 870 m (869 m TVD), triggering a wire line acquisition programme to evaluate this reservoir. Pressure samples were acquired, proving a tight reservoir. Fluid sampling was not attempted. Petrophysical analysis concluded a low permeability siltstone reservoir with low oil saturation. Formation tops came in as prognosed down to top Rogaland Group. In the Rogaland Group, the Lista Formation turned out to be significantly thinner than expected, and the Våle Formation was not present. The deviation is interpreted to be caused by a fault, offsetting the lower part of the Lista Formation and the Våle Formation. The main target in the Shetland Group / Ekofisk Formation was encountered at 2742 m (2567.8 m TVD) with oil shows. Coring was initiated, and two cores containing a total of 36 m of core was recovered. All the formations of the Shetland Group were significantly thinner than prognosed. The matrix properties of the reservoir were within the expected range, but devoid of any open fracture system that could enhance the producability of the reservoir.

The two cores were taken in the Ekofisk and Tor formations and the first one-meter of the Hod Formation over the interval 2746 m to 2782 m with 100% recovery. No wire line logs were run in the Shetland Group, only MWD. No fluid samples were taken in the well.

The well was permanently abandoned on 13 July as a dry well with shows.

### Testing

No drill stem test was performed.
