

### General information

Wellbore name	7220/4-1
Type	EXPLORATION
Purpose	WILDCAT
Status	P&A
Press release	<a href="#">link to press release</a>
Factmaps in new window	<a href="#">link to map</a>
Main area	BARENTS SEA
Discovery	<a href="#">7220/4-1 (Kramsnø)</a>
Well name	7220/4-1
Seismic location	3D survey WG08STR10 : inline 1324 & xline 4288
Production licence	<a href="#">532</a>
Drilling operator	Statoil Petroleum AS
Drill permit	1494-L
Drilling facility	<a href="#">WEST HERCULES</a>
Drilling days	65
Entered date	22.12.2013
Completed date	25.02.2014
Release date	25.02.2016
Publication date	25.02.2016
Purpose - planned	WILDCAT
Reentry	NO
Content	GAS
Discovery wellbore	YES
1st level with HC, age	MIDDLE JURASSIC
1st level with HC, formation	STØ FM
2nd level with HC, age	MIDDLE JURASSIC
2nd level with HC, formation	NORDMELA FM
3rd level with HC, age	TRIASSIC
3rd level with HC, formation	SNADD FM
Kelly bushing elevation [m]	31.0
Water depth [m]	403.0
Total depth (MD) [m RKB]	3240.0
Final vertical depth (TVD) [m RKB]	3239.0
Maximum inclination [°]	4.8
Bottom hole temperature [°C]	105
Oldest penetrated age	MIDDLE TRIASSIC
Oldest penetrated formation	SNADD FM

Geodetic datum	ED50
NS degrees	72° 35' 19.67" N
EW degrees	20° 14' 5.97" E
NS UTM [m]	8062450.07
EW UTM [m]	674650.00
UTM zone	33
NPDID wellbore	7307

### **Wellbore history**

**General**

Well 7220/4-1 was drilled to test the Kramsnø prospect in the Johan Castberg area of the Barents Sea. The primary objective was to prove commercial volumes of hydrocarbons in the Stø, Nordmela and Tubåen formations and confirm the GOC and OWC seen on seismics. Secondary objective was to investigate the Snadd Formation and acquire data for exploration of the Triassic play.

**Operations and results**

Wildcat well 7220/4-1 was spudded with the semi-submersible installation West Hercules on 22 December 2013 and drilled to TD at 3240 m in the Triassic Snadd Formation. No significant problem was encountered in the operations. The well was drilled with Seawater and hi-vis pills down to 744 m, with KCl/polymer/glycol mud from 744 m to 2128 m, and with Low sulphate/KCl/polymer/glycol from 2128 m to TD.

A potential source rock section is proven by sidewall cores and elevated Gamma Ray in the interval 2220 to 2228 m within the Knurr Formation (Late Barremian). This section has TOC from 2.5 to 4.1% and Rock-Eval Hydrogen Index in the range 270 to 370 mg HC/g TOC. The Hekkingen Formation source rock is not present in the well. In the reservoir, the well penetrated sandstone and siltstone of the Jurassic Stø and Nordmela Formations. MDT pressure gradients show a gas column from top Stø Formation at 2267 m and down to a gas/water contact at 2400 m in the Nordmela Formation. The reservoir quality in Stø, Nordmela and Tubåen formations is deteriorated by extensive quartz cementation. There was no oil leg in the well, but weak oil shows are recorded from 2387 m and downwards in the cored section in Nordmela and Tubåen formations. Further weak oil shows (cut fluorescence) are described on cuttings down to 2503 m in the Tubåen Formation.

Triassic sandstones and claystones were encountered in the Fruholmen and Snadd Formations. Gas was found in two zones in the Snadd Formation: from 3002 m with gas down-to contact at 3047 m and from 3117 with gas down-to contact at 3162 m. The overall reservoir quality in Snadd is poor due to the low net thickness of permeable sandstones.

Three cores with a total recovery of 185.4 m were taken in the Stø, Nordmela and Tubåen formations. The core-log depth shifts are -1.7 m, -2.8 m and - 3.3 m for cores 1, 2, and 3, respectively. MDT fluid samples were taken at 2334.4 m (gas), 2393.6 m (gas), 2417.5 m (water), and 3009 m (gas),

The well was permanently abandoned on 25 February 2014 as a gas discovery.

**Testing**

No drill stem test was performed.

**Cuttings at the Norwegian Offshore Directorate**

Cutting sample, top depth [m]	Cutting samples, bottom depth [m]
755.00	3240.00

Cuttings available for sampling?	YES
----------------------------------	-----

**Cores at the Norwegian Offshore Directorate**

Core sample number	Core sample - top depth	Core sample - bottom depth	Core sample depth - uom
1	2274.0	2318.2	[m ]
2	2319.0	2389.7	[m ]
3	2390.0	2460.6	[m ]

Total core sample length [m]	185.5
Cores available for sampling?	YES
