

General information

Wellbore name	7325/1-1
Type	EXPLORATION
Purpose	WILDCAT
Status	P&A
Press release	link to press release
Factmaps in new window	link to map
Main area	BARENTS SEA
Discovery	7325/1-1 (Atlantis)
Well name	7325/1-1
Seismic location	3D survey MC3D-HFC09-inline 2215 & xline 8697
Production licence	615
Drilling operator	Statoil Petroleum AS
Drill permit	1526-L
Drilling facility	TRANSOCEAN SPITSBERGEN
Drilling days	29
Entered date	23.06.2014
Completed date	21.07.2014
Release date	21.07.2016
Publication date	21.07.2016
Purpose - planned	WILDCAT
Reentry	NO
Content	GAS
Discovery wellbore	YES
1st level with HC, age	LATE TRIASSIC
1st level with HC, formation	SNADD FM
Kelly bushing elevation [m]	40.0
Water depth [m]	447.0
Total depth (MD) [m RKB]	2865.0
Final vertical depth (TVD) [m RKB]	2865.0
Maximum inclination [°]	2.7
Bottom hole temperature [°C]	110
Oldest penetrated age	EARLY TRIASSIC
Oldest penetrated formation	HAVERT FM
Geodetic datum	ED50
NS degrees	73° 54' 48.7" N
EW degrees	25° 7' 0.17" E
NS UTM [m]	8203538.99

EW UTM [m]	441758.31
UTM zone	35
NPDID wellbore	7501

Wellbore history

General

Well 7325/1-1 was drilled to test the Atlantis prospect on the western flank of the Hoop Fault Complex in the Barents Sea. The clinofolds of the Upper Kobbe Formation were the main target. Secondary targets included Carnian fluvial/estuarine channel sandstones within the Snadd Formation, possible sand development in the middle/lower part of the Kobbe Formation and shallow marine sandstone in the uppermost Klappmyss Formation

Operations and results

The top interval of the well was drilled according to plan with good parameters, but at 695 m bit, stalling occurred causing no further progress with drilling. The well was given the name 7325/1-U-1 and the well was respudded.

Wildcat well 7325/1-1 was spudded with the semi-submersible installation Transocean Spitsbergen on 23 June 2014 and drilled to TD at 2865 m in the Early Triassic Havert Formation. No significant problem was encountered in the operations. The well was drilled with seawater and sweeps down to 835 m, with KCl/polymer/GEM mud from 835 m to 1696 m, and with Low sulphate KCl/polymer/GEM mud from 1696 m to TD.

Well 7325/1-1 encountered about 55 metres net of reservoir rocks in the Snadd Formation, of which ten metres were gas-filled between 1547.5 and 1560.5 m. Based on the well logs the presence of live HC in several other sand layers in Snadd, Kobbe and Havert formations cannot be ruled out. Poor reservoir properties prevented establishment of pressure gradients and true hydrocarbon/water contacts. Sandstone was not proven in the Klappmyss Formation; however, about ten metres gross of poor quality sandstone was proven in the Early Triassic Havert Formation.

The Stø/Fruholmen formations had oil shows (fluorescence and cut) at 891 - 906 m (Stø/Fruholmen), while the Snadd Formation had oil shows in numerous sandy intervals between 990 and 1580 m.

No coring was performed due to uncertainties around the presence of hydrocarbons while drilling. MDT fluid samples were taken at 904 m (water) and 1555.3 m (gas).

The well was permanently abandoned on 21 July as a technical gas discovery

Testing

No drill stem test was performed.
