

General information

Wellbore name	2/4-22 S
Type	EXPLORATION
Purpose	WILDCAT
Status	P&A
Factmaps in new window	link to map
Main area	NORTH SEA
Field	FENRIS
Discovery	2/4-22 S (Romeo)
Well name	2/4-22
Seismic location	Inline: 7738 - Xline:19082 - 3D survey: VGCNS05Z12
Production licence	146
Drilling operator	Statoil Petroleum AS
Drill permit	1537-L
Drilling facility	MÆRSK GALLANT
Drilling days	166
Entered date	10.09.2014
Completed date	22.02.2015
Plugged and abondon date	22.02.2015
Release date	22.02.2017
Publication date	22.02.2017
Purpose - planned	WILDCAT
Reentry	NO
Content	OIL
Discovery wellbore	YES
1st level with HC, age	PERMIAN
1st level with HC, formation	ROTLIEGEND GP
2nd level with HC, age	MIDDLE JURASSIC
2nd level with HC, formation	BRYNE FM
3rd level with HC, age	LATE JURASSIC
3rd level with HC, formation	ULA FM
Kelly bushing elevation [m]	48.0
Water depth [m]	67.0
Total depth (MD) [m RKB]	4889.0
Final vertical depth (TVD) [m RKB]	4882.0
Maximum inclination [°]	5.3
Bottom hole temperature [°C]	173
Oldest penetrated age	PERMIAN

Oldest penetrated formation	ROTLIEGEND GP
Geodetic datum	ED50
NS degrees	56° 42' 58.2" N
EW degrees	3° 10' 2.98" E
NS UTM [m]	6285944.41
EW UTM [m]	510252.77
UTM zone	31
NPDID wellbore	7535

Wellbore history

General

Well 2/4-22 S was drilled to test the Romeo on the Hidra High adjacent to the King Lear discovery in the North Sea. The primary objective was to prove commercial accumulations of recoverable hydrocarbons within Sandstone of the Rotliegandes Group.

Operations and results

Wildcat well 2/4-22 S was spudded with the jack-up installation Mærsk Galant on 10 September 2014 and drilled to TD at 4889 m in the Permian Rotliegandes Group. The 8 1/2" section was drilled under HPHT procedures. No significant problem was encountered in the operations. The well was drilled with seawater down to 298 m, with Glydril mud from 298 m to 1001 m, with Versatec oil based mud from 1001 m to 4358 m, and with WARP oil based mud from 4358 m to TD.

Hydrocarbons were found in the Jurassic Ula and Bryne Formations and in the Permian Rotliegandes Group, Auk Formation Equivalent. The hydrocarbons in all reservoir correspond to light oil (density of 0.6 g/cm3). Two source rock sequences are penetrated in the well: the Late Jurassic Mandal-Farsund formations and high-TOC carbonaceous shales of the Bryne Formation. No Triassic rocks were seen in the well. No oil shows above the oil based mud were recorded. High gas response was recorded when drilling the organic rich shales in the Mandal and Farsund formations.

No cores were cut in the well. Formation fluid samples were acquired in the reservoir using the MDT. Depth correlation and sampling operations were difficult due to the well conditions and failure of the hydraulic units in the MDT strings. Oil was sampled at 4628 m, 4630.8 m and 4678.5 m. Water was sampled at 4875.6 m.

The well was permanently abandoned on 22 February 2015 as an oil discovery.

Testing

No drill stem test was performed.
