Wellbore history

Well 15/6-15 was drilled to test the Freke-Garm prospect on the Gudrun Terrace in the North Sea. The primary objective was to test the hydrocarbon potential in the Middle Jurassic Hugin and Sleipner formations. The secondary objective was to test the Triassic Skagerrak Formation.

Operations and results

An 8 1/2" pilot hole 15-6/U-5 was drilled 1390 m MD. The pilot was drilled in parallel with the main bore. No shallow gas was observed.

Wildcat well 15/6-15 was spudded with the semi-submersible installation Deepsea Stavanger on 18 May 2019 and drilled to TD at 3795 m in the Triassic Skagerrak Formation. Operations proceeded without significant problems. The well was drilled with seawater and hi-vis pills down to 1377 m, with KCl-polymer mud from 1377 m to 3033 m and with Innovert oil-based mud from 3033 m to TD.

Well 15/6-15 encountered the Sleipner Formation with a thickness of about 124 meters, of which 45 meters were reservoir sands of good to moderate reservoir quality. The Skagerrak Formation was encountered with a thickness of about 150 meters, of which 16 meters were reservoir sands with poor reservoir quality. The well is dry without shows

No cores were cut. No fluid sample was taken.

The well was permanently abandoned on 2 June 2019 as a dry well.

Testing

No drill stem test was performed.
